technological, natural, governance measures, and strategies. Carbon mitigation pathways mainly involve reducing carbon emissions by utilizing alternative technologies, increasing carbon sinks, and capturing carbon. For accounting purposes, new and more reliable data is becoming available with the spread and advances in information and communication technologies; therefore, it is easier to develop, test, and improve models and metrics.

Carbon is on the agenda of every individual on earth since it cannot be researched in isolation from the other elements of the ecosystem. Energy generation and use are at the focus of carbon management since it is directly related to carbon emissions and all sectors are interconnected with energy. The building sector is the biggest emitter and provides the biggest opportunities for change with the least amount of cost. Also, environmental awareness is increasing. While the scope of carbon management stays on mitigation, experimental lifestyles, and economies of low-carbon, zero-carbon, or carbon-neutral qualities, are being developed, and there are some implementations.

Transitioning to lower carbon from traditional systems necessitates socio-economic transitions, mitigation costs, social acceptability, employment effects, and risk management, as well as policies of decision-makers. Linkages between sectors, supply-demand, adaptation pathways, environmental behavior, synergies, cobenefits, and tradeoffs are relevant research areas. Whether mitigation effects will be successful post-Paris Agreement is an ongoing intellectual debate. However, every study emphasizes that decisions today will have an impact on the global climate. Delaying mitigation restricts the options of carbon management pathways for a target global temperature increase, thus continuous efforts are necessary.

Definition

Contextualizing carbon offsets, Kolk et al. (2008, p. 722) defend that carbon trading has emerged as the basis of the growing global climate regime, improving and facilitating the convergence of business, governments, NGOs, and academics and professionals around a somewhat fragmented, decentralized, and market-oriented mode of

carbon governance (Aulisi et al. 2005). Referring to the history of carbon offsets, in the beginning, they were created to establish relationships between market environmentalist-oriented NGOs and large companies to reduce the carbon footprint of investors with a clearly philanthropic and ethical objective (Bayon et al. 2012). The first voluntary carbon offsets born in 1989 when AES Corporation (from the United States of America) invested in agroforestry in Guatemala (Hawn 2005).

Introduction

Parallel to the Clean Development Mechanism created by the Kyoto Protocol, a voluntary market for carbon offsets has emerged particularly oriented to those organizations or individuals in countries where strategies are against the Kyoto Protocol (Bumpus and Liverman 2008). Contextualizing carbon offsets, Kolk et al. (2008, p. 722) defend that carbon trading has emerged as the basis of the growing global climate regime, improving and facilitating the convergence of business, governments, NGOs, and academics and professionals around a somewhat fragmented, decentralized, and market-oriented mode of carbon governance (Aulisi et al. 2005). Referring to the history of carbon offsets, in the beginning, they were created to establish relationships between market environmentalist-oriented NGOs and large companies to reduce the carbon footprint of investors with a clearly philanthropic and ethical objective (Bayon et al. 2012). The first voluntary carbon offsets born in 1989 when AES Corporation (from the United States of America) invested in agroforestry in Guatemala (Hawn 2005).

Carbon trading provides a flexible mechanism to emission reductions at relatively low cost, offering profitable opportunities for firms for developing technologies, products, or tools that decrease emissions (Kolk et al. 2008, p. 722). Firms have several incentives to participate in carbon trading. For instance, Kolk et al. (2008) suggest that firms can engage in voluntary trading

systems for gaining credit for early action or for gaining competitive advantage through early trading experience. Moreover, participating in a voluntary carbon trading allows larger firms to develop an emission management system for their international operations, needed for continuing operating in these markets. Carbon offset has gained some attraction and momentum mainly among consumers in Western countries who have become aware and who are concerned about the potentially negative environmental effects of energy-intensive lifestyles and economies, and moreover, because they are also aware about the co-benefits of achieving and reinforcing the sustainable growth in developed and developing countries (Harper et al. 2007). It must be noted that carbon offsets were designed as a solution to the deficiencies evidenced in the previous projects to reduce carbon and greenhouse gas emissions (e.g., the European Carbon Emission Trading Scheme). It offered a possibility of solution with a “win-win” paradigm that would allow the countries to reduce their carbon emissions at a lower cost and obtain financing that would allow them to follow a “climate-friendly orientation” (Wara and Victor 2008).

Carbon Trust (2006, p. 7) suggests that there are three stages that a company can focus on to reduce carbon emissions and mitigate climate change. In the first and second stage, organizations focus their efforts on reducing direct and indirect emissions, respectively. The third stage is optional and is focused on offsetting – it may then be appropriate for some companies to develop a voluntary offsetting strategy. Carbon offsetting is where a company buys credits associated with environmental projects that reduce emissions of carbon dioxide or other greenhouse gases around the world, as a way of offsetting their own carbon emissions. For some service-sector or consumer-facing organizations, there may be corporate social responsibility benefits from offsetting some of their emissions. For any offsetting strategy to be successful, it is key that the offsets purchased are of high quality and from verified projects that create truly additional emission reductions.

In this context, the market for carbon offsets is another form of voluntary carbon trading; firms sell offsets to consumers and firms who wish to reduce their carbon impact (Kolk et al. 2008). A carbon offset is a reduction in emissions of carbon dioxide or greenhouse gases made to offset an emission made elsewhere (Goodward and Kelly 2010). As Taiyab (2006, p. 1) proposes, “the voluntary market of carbon offsets consists of companies, governments, organizations, organizers of international events, and individuals, taking the responsibility for their carbon emissions by voluntary purchasing carbon offsets. These voluntary offsets are often bought from retailers and organizations that invest in a portfolio of offsets projects and sell slices of the resulting emissions reductions to customers in relatively small quantities.” In this line, the essential of carbon offsets is that they mitigate the share of carbon emissions (Galatowitsch 2009). Moreover, Galatowitsch (2009) clearly postulates that “the general approach for carbon offsetting is based on the project and the seller of projects commits to provide a stable and permanent reservoir of carbon.”

There is no consensus about the definition of carbon offsets. As Carbon Footprint pointed out in their website, “a carbon offset is a way to compensate for the emissions by funding an equivalent carbon dioxide saving elsewhere. Our everyday actions, at home and at work, consume energy and produce carbon emissions, such as driving, flying and heating buildings. Carbon offsetting is used to balance out these emissions by helping to pay for emission savings in other parts of the world.” At this respect, Carbon Footprint “offers a range of carbon offset projects to international standards, including the Verified Carbon Standard (VCS), Gold Standard Voluntary Emission Reductions (VER) and Certified Emission Reductions (CER). All of which meet the Quality Assurance Standard for Carbon Offsetting following a footprint calculation on this web site and BSI’s PAS 2060 specification on carbon neutrality. Many of the carbon offsetting projects also provide wider benefits in addition to carbon reduction, such as biodiversity, education, jobs, food security and health and well-being in

developing countries.” Bumpus and Liverman (2008) also define carbon offsets as “occurring when one actor (individual, company, NGO, or state) invest in a project elsewhere that results in a reduction of greenhouse gas emissions that would not have occurred in the absence of the project.”

In more detail, the objective of carbon offset – as voluntary tax of sorts – is to reduce the carbon footprint to the minimum possible, to zero. Carbon offsets, as a voluntary carbon trading mechanism, was conceived with the aim of reducing, mitigating, and reducing carbon emissions, a reduction that would entail a series of social and environmental benefits to the organizations that achieved it (Klooster and Masera 2000; Galatowitsch 2009). In this sense and as Kollmuss et al. (2008) propose, the scope of carbon offsets has been increased to include energy efficiency, renewable energy, methane/carbon capture/geological storage, and a large list of biosequestration options.

For Wara and Victor (2008, p. 131), “carbon offsets allow carbon to be reduced by compensating for excess emissions in one location through carbon reductions in another. Countries, companies, and individuals have decided to reduce carbon for reasons than include environmental concern, competitive advantage, regulations and incentives, and they are interested in offsets as a cheaper alternative to expensive or difficult internal reductions.” Carbon offsets emerge, therefore, from the debate on the need to mitigate and reduce climate change as much as possible; this carbon trading plays a fundamental role in responding to the perceived gap in the market for carbon (Bumpus and Liverman 2008).

Carbon offset as a voluntary carbon trading is needed to achieve reductions in carbon and greenhouse gas emissions more easily, cheaply, and quickly than local or domestic reductions would imply (Wara and Victor 2008). This, in turn, would have benefits for the atmosphere and guarantee sustainable development. It is, therefore, a new project that solves the weaknesses of the previous ones in order to provide a new form of financing to reduce carbon emissions as well as to improve the conservation of the atmosphere and

obtain business opportunities (Wara and Victor 2008; Bayon et al. 2012).

The purpose of carbon offset, therefore, is to reduce or neutralize a ton of CO₂ or equivalent that has been emitted in a certain place by avoiding the release of one ton of CO₂ or equivalent elsewhere, or, where appropriate, by absorbing and/or sequestering a ton of CO₂ or equivalent that could have remained in the atmosphere (Taiyab 2006). These carbon offset projects get carbon credit or emission reductions that can be exchanged – or bought – by individuals, organizations, governments, and other agents to reduce and neutralize the greenhouse gas emissions. That is, through carbon offset as a voluntary carbon trading, companies, organizations, and other potential buyers offset their annual carbon emissions and get a neutral balance of emissions.

It should be noted, however, a peculiarity of carbon offset versus another type of carbon trading. In this mechanism, the concept of additionally is fundamental (Taiyab 2006; Bumpus and Liverman 2008). That is, the emission reductions that may be exchanged in carbon trading must be additional to those that are generated in the normal course of business, in the business-as-usual scenario proposed by Taiyab (2006). This additionally principle assumes that if carbon credits are not additional to the business-as-usual scenario, they cannot be considered carbon offsets. We understand, therefore, the carbon offsets as carbon credits that emanate from additional projects that generate carbon emissions. For example, additionally can be demonstrated by showing how a project would not be profitable or not enough to obtain financing without the sale of carbon credits; or a technology could not be adopted without the sale of carbon credits.

The trade of carbon trading takes place, therefore, when an entity (be it a company, individual, organization, government, or other agent) purchases emission credit or allowance to give a quantity of carbon emissions to another agent that allows it to comply with the established amount of carbon emissions. This amount can be determined voluntarily or based on a regulatory regime. These emission credits can be acquired through project-based transactions or allowance-based transactions (as Taiyab

2006, pointed out). Project-based transactions consider that carbon credits are purchased for a specific project, while allowance-based transactions consider that carbon emission allowances are regulated by regulators in a cap-and-trade regime. The regulating organisms establish the allowed emissions that each participant can emit and then issue allowance units to the rest of participants which represents the caps. Each participant is then free to buy and sell their allowances, so that at the end of the period, each participant holds an amount of allowances that represent their current emissions. This is the fusion of the carbon market.

As additional clarification, it must be noted that although the carbon offsetting is possible to occur through local exchange, the reduction in the amount of carbon emissions could be located anywhere (Bumpus and Liverman 2008). It is possible to reduce carbon emissions through carbon offsetting without the need of a relationship or national context. In this way, carbon offset is guaranteed to be more effective than other carbon trading mechanisms, and a less costly mitigation system for climate change is provided.

However, as in the case of carbon footprints, there is no universally accepted standard for accounting for offsets, verifying, and controlling them (Galatowitsch 2009). As Bumpus and Liverman (2008) pointed out, understanding carbon reductions through baseline calculations is extremely complex and difficult. A clear and credible measure is necessary to calculate the carbon offsets. Normally, the basis for calculation with the greenhouse gas emissions exists without the project taking place (given the previously commented requirement of additionally). Subsequently, the carbon offsets are calculated as the difference between the baseline emissions and the carbon emissions with the offset project; this difference represents the total amount of carbon credits that can be exchanged in the carbon trade (Taiyab 2006). Therefore, in order for the reductions to really be real, they must be measured and verified independently by a third party (Taiyab 2006); with this, investors are really aware that the reduction has been effective and reliable. Galatowitsch (2009) describes the certification

process based on a first step in which the carbon sources and sinks are estimated within a defined area project. This evaluation by the regulatory organization is also collected and analyzed by Wara and Victor (2008). These authors point out that the host governments and investors seek to guarantee that the efforts in the reduction of carbon emissions are real and true; but on many occasions, the regulator does not have access to the information required to evaluate these claims. Given the possible discretionary behavior (the third-party certifiers are paid by their own project developers), it is possible that the certifiers approve the projects even when it is not possible to guarantee the integrity of the verification process.

Within the carbon offsets, it should be noted that there are two existing markets: a greater compliance market and a smaller voluntary market. In the first one, companies, governments, or other entities buy carbon offsets to comply “with a note” the total amount of carbon dioxide that they are allowed to emit. This market exists to achieve compliance with the obligations of the Kyoto Protocol and entities prone to the European Union Emission Rights Trade Regime. In the second smaller market, individuals, companies, or governments buy carbon offsets to mitigate their own greenhouse gas emissions; these emissions can come from transportation, the use of electricity, and other sources.

Aiming to summarize the main characteristics of voluntary carbon offsets with respect to other carbon trading mechanisms (for instance, the Clean Development Mechanisms), we refer to the previous studies of Harris (2006), World Bank (2007), Clean Air-Cool Planet (2006), and Bumpus and Liverman (2008). Following these authors, carbon offsets lack a standard and universally accepted definition, although it is true that their different meanings usually include common terms such as voluntary emission reduction and voluntary carbon unit. Similarly, there is no common and homogeneous standard (we can only refer to the code of practice that is available in the British government). Regarding the overarching governance structure, there is no formal and common structure. In practice, the overall

governance of each offset project is decided between the different participants or actors that implement the project, that is, between buyers and sellers of emission credits. Carbon offsets do not require a project design document either, although it can be used by the agents involved. Private contracts are established by the project developers and credit buyers in accordance with the size and nature of the carbon offset.

The concept of additionally and baselines may or may not be explicitly included in the project documentation. The sellers of credits can be any voluntary offset retailers, while the buyers of credits could be covered under the Kyoto Protocol or European Emissions Trading Scheme, companies, organizations, individuals, governments, NGOs, and so on. It should be noted as one of the main differences with respect to other carbon trading mechanisms that transaction costs are lower. There is no formal registration requirement nor is it necessary to use officially required third-party verifiers (although it is recommended). As a numeric data, Bumpus and Liverman in 2008 pointed out that the average price per ton of CO₂ or equivalent is around \$10.00 in comparison with \$10.90 when the Clean Development Mechanism is adopted.

Finally, and again referring to the previous author Galatowitsch (2009, p. 568), carbon offsets as a voluntary carbon trading will reduce coal and greenhouse gas emissions in the future provided that the benefits associated with such reduction are an essential part in all types of carbon emission trading standards. Also, keep in mind that the estimation and accounting of carbon offsets can create incentives for long-term stewardship. Finally, a process of verification of estimates and accounting of carbon offsets, with comprehensive assessments that are universal, is required. However, carbon offset does not always achieve a reduction in carbon/greenhouse gas emissions or that the investment made is really solid (Wara and Victor 2008).

In practice, it has been shown that there has been no reduction in carbon emissions through carbon offsets, and the future trend seems to continue similar or even worse. Therefore, a reform is required where emission credits clearly allow

reducing carbon emissions. Therefore, a much more effective control is demanded.

Definition

Carbon trading provides a flexible mechanism to emissions reductions at relatively low cost, offering profitable opportunities for firms for developing technologies, products, or tools that decrease emissions (Kolk et al. 2010, p. 722). Carbon trading schemes impose a carbon price but without political costs of direct taxes. In this context, it is necessary to talk about a “win-win” process; in it, firms that proactively act in terms of climate change win, but also governmental authorities, NGOs, environment, society, investors, customers, and so on. Carbon and emissions trading is a very complex system with a very simple objective: to reduce the costs that companies and governments must allocate to meet emission reduction objectives.

Introduction

Kolk et al. (2008, p. 722) defend that carbon trading has emerged as the basis of the growing

global climate regime, improving and facilitating the convergence of business, governments, NGOs, and academics and professionals around a somewhat fragmented, decentralized, and market-oriented mode of carbon governance (Aulisi et al. 2005).

Carbon trading provides a flexible mechanism to emissions reductions at relatively low cost, offering profitable opportunities for firms for developing technologies, products, or tools that decrease emissions (Kolk et al. 2008, p. 722). Carbon trading schemes impose a carbon price but without political costs of direct taxes. In this context, it is necessary to talk about a “win-win” process; in it, firms that proactively act in terms of climate change win, but also governmental authorities, NGOs, environment, society, investors, customers, and so on. Carbon and emissions trading is a very complex system with a very simple objective: to reduce the costs that companies and governments must allocate to meet emission reduction objectives.

Firms have several incentives to participate in carbon trading schemes. For instance, Kolk et al. (2008) suggest that firms can engage in voluntary trading systems for gaining credit for early action or for gaining competitive advantage through early trading experience. Moreover, participating in a voluntary trading scheme allows larger firms to develop an emissions management system for their European operations, needed for continuing operating in these markets.

Conceptualizing it, set up in 2005, the EU emissions trading system (EU ETS) is the world’s first and biggest international emissions trading system, accounting for over three-quarters of international carbon trading. Gilbertson and Reyes (2006, p. 28) point out that the idea of compensation did not start with the Kyoto Protocol or the CO₂ trade. Already in the first systems of commerce of pollution, governments and private companies looked for ways to inject extraordinary permits, for a low price, in the market, in order to make it even easier for them to meet the objectives than what would result with the cap and barter systems. In 1976, a policy was enacted in the United States that allowed new sources of contamination to be located in places where

fixed ceilings were not being reached, provided they obtained “compensation” credits generated by other projects that saved or reduced emissions.

As it was described in its website (https://ec.europa.eu/clima/policies/ets_en), “the EU ETS is a cornerstone of the EU’s policy to combat climate change and its key tool for reducing greenhouse gas emissions cost-effectively. It is the world’s first major carbon market and remains the biggest one.” Meanwhile, Grubb and Neuhoﬀ (2006, p. 2) highlighted that the EU ETS has an efficient and effective market design that risks being undermined by three interrelated problems: the approach to allocation; the absence of a credible commitment to post-2012 continuation; and concerns about its impact on the international competitiveness of key sectors. Moreover, these authors also point out that covering almost half of all EU CO₂ emissions, it forms the centerpiece of European policy on climate change. Trade in these emission allowances gives value to reducing CO₂ emissions and has formed a market with an asset value worth tens of billions of euros annually. Putting a price on carbon has been an achievement of global significance, through the linkages to emission credits generated under the Kyoto mechanisms (p. 3).

In terms of data, the EU ETS operates in 31 countries (all 28 EU countries plus Iceland, Liechtenstein, and Norway), limits emissions from more than 11,000 heavy energy-using installations (power stations and industrial plants) and airlines operating between these countries, and covers around 45% of the EU’s greenhouse gas emissions.

The EU ETS works on the “cap and trade” principle. A cap is set on the total amount of certain greenhouse gases that can be emitted by installations covered by the system. The cap is reduced over time so that total emissions fall. Within the cap, companies receive or buy emission allowances which they can trade with one another as needed. They can also buy limited amounts of international credits from emission-saving projects around the world. The limit on the total number of allowances available ensures that they have a value. After each year a company must surrender enough allowances to cover all

its emissions, otherwise heavy fines are imposed. If a company reduces its emissions, it can keep the spare allowances to cover its future needs or else sell them to another company that is short of allowances. Trading brings flexibility that ensures emissions are cut where it costs least to do so. A robust carbon price also promotes investment in clean, low-carbon technologies.

Then, by EU emission trading rights we refer to the system that legally requires companies to be assigned quotas for their carbon and greenhouse gas emissions according to the objectives of their respective governments in environmental matters. This system is highly practical because it allows firms to surpass their emissions quota as long as they can find other companies producing fewer emissions to sell them their quotas. On the one hand, this system offers certain flexibility, while restraining further damage to the environment. It also fosters the development of new technologies, as organizations, motivated by the benefits they can obtain from selling their emissions, will develop and employ clean technologies.

The firms that participate in the carbon emissions system will be regulated by their respective national authorities or by the European Commission, in accordance with the principle of subsidiarity. Regulations are usually very formal and noncompliance with requirements can result in legal procedures, fines, or prosecution. Therefore, they set binding obligations on companies and act as a coercive pressure to change organizational activities (Dimaggio and Powell 1983). Regulation can put constraints on companies and, it has been argued, inhibit the development of voluntary reporting practices (Higgins and Larrinaga 2014). Coercive pressures may be felt as force, as persuasion, or as invitations to join in collusion (Dimaggio and Powell 1983). Companies that have installations regulated under the EU emissions trading schemes are required annually to report on direct carbon dioxide emissions to a regulatory authority (Kauffmann et al. 2017).

According to MacKenzie (2007), the trading of emissions requires companies to perform their activities under a new scheme that will develop new knowledge and skills within the organization. Likewise, companies need to

develop organizational routines to negotiate emission and to represent this new objective in their accounting system. Also, according to MacKenzie (2007) and Lovell et al. (2010), there are two main types of emission trading schemes: cap-and-trade-schemes and project-based schemes. In the cap and trade system emission reduction objectives are established, carbon emission can be bought and sold and the companies emitting greenhouse gases must have enough rights to cover their emissions (Russell-Smith et al., 2009). This is the more easily implemented scheme, since the alternative (credit-based) systems entail high transaction costs because it is necessary to demonstrate for each emission reduction project that the reduction was achieved to levels below the reference level. This verification means that the administrative workload is much heavier under this system (Del Río 2005). Moreover, the reference level must be negotiated with the sectors (Convery and Redmond 2007), which can also involve high administrative and transaction costs.

In any case, the idea of emissions trading is to guarantee equal treatment of similar sized firms in the framework of a carbon emission trading system, to reduce to a minimum the possibility of competition distortion, to guarantee synergy with current regulations, to ensure the effective application of the system and to guarantee compatibility with the system provided for in the Kyoto Protocol. According to Scott (2013), companies are expected to comply with regulatory requirements to avoid prosecution or legal action and so ensure that legitimacy is maintained in society.

At this respect, also Ellerman et al. (2010) highlight the emission trading as the basic policy instrument; it involves an overall cap per unit of time on the emissions to be permitted and allocates allowances of permits to emitters such that the sum of the allocations do not exceed the cap (p. 3).

As pointed out by Gilbertson and Reyes (2006), in theory, it would be expected that the offer of emission permits will be reduced in the coming years and that a turning point will be established from which it will begin to be scarce; this would mean that the market would continue

to maintain its value and, in addition, pollution levels would be significantly reduced.

However, this reduction from the environmental point of view depends on the “cap” prefixed as the allowed limit of pollution level in a specific period of time. Therefore, the “trading,” although basic in the ETS, does not allow to reduce the general contamination levels if there is no previous reduction in cap. What it allows is that companies have a greater margin of maneuver, more flexible, to address the problem of the level of pollution and emissions. The reality is that those organisms that exceed the maximum allowed threshold of pollution reduction can sell their surplus to those organisms that have not fulfilled their obligations in reducing the level of contamination.

That is, this system translates into a market in which those agencies that reduce pollution levels above what is legally required can obtain an additional benefit derived from selling them to those “most polluting.” The organisms that do not comply with the legal requirements can continue to pollute since they can buy such credits at a very economic price without having to modify their practices, activities, strategies, etc.

That is why several authors such as Gilbertson and Reyes (2006) make a profound criticism of the ETS system. They clearly point out in their book that the ETS has not managed to reduce emissions, the cap and trade threshold established to cover the level of pollution has been much more generous than necessary; this has made it possible for the allowance to be sold to other polluting industries that, in this way, do not have to limit their greenhouse gas emissions either.

To date, the aforementioned authors indicate (p. 13) that the number of permits granted is calculated based on the existing levels of pollution, which means that the industries that have contaminated the most in the past are rewarded with the most important. Giving these rights to the industries that pollute the most is also one of the most regressive projects in history regarding the creation and distribution of property rights.

Moreover, the Paris Agreement provides for a robust and ambitious basis for the use of international markets and reinforces international targets, transparency, and the accountability of Parties.

Recognizing the importance of international carbon markets, Article 6 of the agreement allows parties to use international trading of emission allowances to help achieve emissions reduction targets and establishes a framework for common robust accounting rules, and creates a new, more ambitious market mechanism.

At this regard and under the numerous gaps in the first and second phase of the EU ETS, in December 2008, the EU approved the incorporation of significant changes in EU ETS for the third phase, which extends from 2013 to 2020. Gilbertson and Reyes (2006, p. 51) in their in-depth review of the EU ETS point out that the new rules establish a formal limit on the use of compensation credits; the national allocation plans disappear to give way to a common allocation plan for the whole EU and a greater use of the auction mechanisms is foreseen. These changes have been promoted as a way to make the cap more stringent, accompanied by the idea that this step should favor further reductions and boost the price of emission rights up to a level that encourages a shift toward low technology. However, these authors point out that there are still important gaps and that, in addition, new ones arise related to the accumulation of surplus credits of the second phase; exemptions from the rules for sectors exposed to international competition and the possibility of trading offset credits in sectors not covered by the EU ETS; the incorporation of new sectors, such as aviation; the expansion of the program to include all greenhouse gases in it; and the increasing complexity of the financial instruments, futures markets, and derivatives through which the emission rights are marketed, suggest that the cap will continue to be plagued by large gaps.

The European Commission points out that the surplus of emission rights is partly due to the economic crisis (whose effects caused a reduction in emissions higher than expected) and to the high imports of international credits. This has caused a fall in carbon prices, which, in turn, discourages the reduction of emissions. In the short term, the surplus threatens to undermine the proper

functioning of the carbon market. In the long term, it could affect the EU ETS's ability to cost-effectively meet more stringent emission reduction targets. In figures, the surplus was around 2 billion emission rights at the beginning of the third phase and reached 2,100 million in 2013. In 2015, this amount was reduced to 1,780 million as a result of the postponement of the auctions ("back-loading"). Without this postponement, the surplus would have increased by almost 40% by the end of 2015.

At this regard, the European Commission presented in July 2015 a legislative proposal to revise the EU ETS for the period after 2020. This is the first step in delivering on the EU's target to reduce greenhouse gas emissions by at least 40% domestically by 2030 in line with the 2030 climate and energy policy framework and as part of its contribution to the Paris Agreement. To achieve at least 40% EU target, the sectors covered by the ETS have to reduce their emissions by 43% compared to 2005. To this end, the overall number of emission allowances will decline at an annual rate of 2.2% from 2021 onwards, compared to 1.74% currently. This amounts to an additional emissions reduction in the sectors covered by the ETS of some 556 million tons over the decade — equivalent to the annual emissions of the UK.

Synonyms

[Collaborative consumption](#); [Collaborative economy](#); [Peer economy](#)

Definition

In the consumer market, IoT technology refers to products that can be controlled via remote devices, such as smartphones. The growth of the Internet and its use of big data has facilitated the connection between asset owners and those seeking to use those assets. This sort of dynamic can also be referred to as shareconomy, collaborative consumption, collaborative economy, or peer economy. Collaborative consumption is at the basis of car sharing. The term car sharing indicates a service that involves the use of a car shared with different users, paying only for its use, based on the time for which it is available, on the kilometers traveled, or both of these factors. It, therefore, allows an alternate use of the same vehicle by more people where each contributes to a share of the incurred expenses. Carpooling, defined as a group of people who travel together, usually in a different member's car each day, is an evolution of car sharing services. This mode of transport is widespread in work or university environments, where various subjects, who travel the same route in the same time slot, spontaneously agree to travel together with a significant contribution to the development of eco-sustainable mobility.

Introduction

Internet of Things (IoT) is a neologism used in the language of telecommunications, which defines

real objects connected online, which interact electronically and transfer data and information (Ashton 2009). In the consumer market, IoT technology refers to products that can be controlled via remote devices, such as smartphones. The growth of the Internet – and its use of big data – has facilitated the connection between asset owners and those seeking to use those assets. This sort of dynamic can also be referred to as the shareconomy, collaborative economy, or peer economy (Chappelow 2019). Sharing economy is proposed as a model that makes sharing, active participation, and sustainability the new means to achieve an environmentally-friendly collective action against hyper-consumerism (Heinrichs and Rita 2015). Sharing economy is related to circular economy, which aims to minimize waste and enhance collaborative consumption in which an item is consumed by multiple people (Botsman and Rogers 2010). An example of sharing economy is car sharing. In car sharing, the consumer purchases the use of the vehicle instead of the vehicle itself and shares it with other consumers since private vehicles go unused for 95 percent of their lifetime (Hahn and Metcalfe 2017; Chappelow 2019).

Sharing Economy

The public perception of shared goods – the notion of sharing bikes, cars, or rides on an on-demand basis – has gained widespread popularity. This is true especially in the context of big cities that struggle with population growth and increasing density where sharing vehicles promises to reduce inner-city traffic, congestion, and pollution problems and, at the same time, reduce costs for consumers (Cohen and Kietzmann 2014).

Peer-to-Peer

The most common sharing economy business model is peer-to-peer (P2P). In this model, the sharing economy platform acts as an intermediary between supply and demand, allowing products or services to be shared between individuals. By using the available platform – that is maintained

and guaranteed by a private or public entity – the service providers and the service consumers are directly put into contact with each other. Sometimes, it may also happen that the two sides coincide, so a consumer is also a supplier and vice versa. Examples of companies that use this model are Airbnb and Zipcar.

Business-to-Business

A second business model involves inter-company, business-to-business (B2B) exchange. The company provides a good or service to another company. It works just like P2P only that it generally requires infrastructure contractors, industrial companies, municipalities, or the armed forces. An example of a company that uses this model is United Rentals.

Business-to-Consumer

The sharing economy also includes features in common with traditional business models, where companies make their service available directly to users – business-to-consumer (B2C). In B2C, companies provide the platform and are also the suppliers of the good or service. The most significant examples of this business model are car sharing and bike sharing platforms like Enjoy or Bikemi.

Consumer-to-Business

The last model is a relatively recent model that is emerging – consumer-to-business (C2B). In this model, consumers offer goods and services to businesses, through websites, blogs, or forums using intermediary systems like PayPal, Google AdSense, and Google Wallet for payments, even though there are still some pending tax issues. An example of a company that uses this model is Fotolia, a site where consumers can post their digital content (images, animations, videos) and sell them to different companies (Moncada et al. 2018).

On top of the advantages of an improved lifestyle, car sharing also has a significant impact on security and the market. Private cars often carry only the driver and are used for short periods during the day, while the shared car allows more intensive use of the individual vehicle [3]. Shared

cars tend to be renewed more frequently due to mileage and not to aging than the private cars they replace. Users will then drive more modern technologically advanced vehicles with several advantages, such as greater road safety and lower emissions and consumption (Shaheen et al. 2016).

Collaborative Consumption

Collaborative consumption refers to resource circulation systems in which consumers may act as both providers of resources and obtainers of resources (Dhingra and Stanich 2013). Resource circulation systems include (Table 1).

Therefore, exchanges in collaborative consumption may be performed directly on a peer-to-peer basis or indirectly through an intermediary (Ertz et al. 2019).

Car Sharing

Collaborative consumption is at the basis of car sharing. The term car sharing indicates a service that involves the use of a car, shared with different users, paying only for its use, based on the time for which it is available, on the kilometers traveled, or both of these factors. It, therefore, allows an alternate use of the same vehicle by more people where each contributes to a share of the expenses to be incurred.

The first reference to car sharing was in 1948 in Switzerland, followed by car share projects in the

early 1970s in France and some examples in the first half of the 1990s in Switzerland and Germany but also on a smaller scale in Canada, the United States, the Netherlands, and Sweden. But it was not until Benoît Robert founded Communauto in Quebec City in 1994 that car sharing became a term of common use (Shaheen et al. 2016).

Today, many car sharing services have evolved and have created a demand for new car sharing models. Generally, though, car sharing programs fall into one of four sharing models:

- Roundtrip: members begin and end their trip at the same location, often paying by the hour, mile, or both.
- One-way: members begin and end their trip at different locations.
- P2P: operates just as roundtrip or one-way with a sharing system operated by a third party; however, the vehicles themselves are typically privately owned or leased – the owner rents his car at times of nonuse, in exchange for an economic return.
- Fractional ownership: allows users to co-own a vehicle and share its costs and use (Shaheen et al. 2017).

The complete service, from the search for the car to its release, is managed via the Internet, through smart cards that enable the use of the car, computerized management of emergencies or malfunctions, refueling, and invoice accounting (Iacovini 2014).

The car, thanks to car sharing, goes from being a durable consumer good to a service eliminating the burden of ownership – original purchase, insurance, taxes, maintenance, overhaul, and fuel – and is still available at lower rates than would be paid if utilizing a public service such as a taxi. In addition, replacing private automobiles with shared ones directly reduces demand for parking spaces, traffic congestion, and environmental impact, thanks to lower harmful emissions (Cervero 2002).

For future applications, car sharing companies are investing in self-driving cars, blockchain technology - to record ownership, usage of shared vehicles, and insurance information - and plug-in

Carpooling, Table 1 Collaborative consumption resource circulation systems (Botsman and Rogers 2010)

Product-service systems	Privately owned goods can be shared or rented out via P2P marketplaces allowing consumers to engage in monetized exchanges for temporary access to goods
Redistribution markets	Goods, used or new, are passed on from someone who does not want them to someone who does
Collaborative lifestyles	Extends the exchange from physical goods to the sharing of time, skills, space, and money

hybrid electric vehicles (PHEV), to reduce gas consumption (Zoepf 2015).

Carpooling

Carpooling, defined as a group of people who travel together, usually in a different member's car each day is an evolution of car sharing services (Cambridge Dictionary 2019).

Carpooling was born in San Francisco, at the end of 1914, when car owners began offering seats in their cars for the same price as a streetcar fair, known as a jitney (Cozza 2012). Although this caused an immediate boom, ridesharing and carpooling remained at a low ebb until World War II when the federal government, facing the need to conserve oil resources for the war effort, worked alongside the oil industry to push drivers to take passengers along when they drove (Oliphant and Amey 2010). By the late 1970s, President Carter proposed multiple initiatives to encourage further ridesharing such as appointing the National Task Force on Ridesharing, which provided assistance and incentive programs. The first regional carpool services were introduced, and use was promoted as a way to reduce local air pollution. Participation declined though with the fall of oil prices in the 1980s, and it was only with the advent of smartphones in 2007 that carpooling was rediscovered (Oliphant and Amey 2010).

Today, the constant connection to the Internet, and the additional flexibility provided by modern information technology, made carpooling more viable again (Shaheen et al. 2016). Network platforms have allowed to overcome the constraint of sharing a car trip with strangers. Thanks to a comment evaluation system present on the platforms, it is possible to know in advance the usual behavior of a traveling companion or driver, facilitating the overcoming of distrust. The consumer chooses the desired route, contacts the driver, meets at an agreed-upon location, and travels together. Especially at an aggregate level, research has shown that in the absence of adequate public transit, commuters opt for ridesharing (Cozza 2012).

Also, there are strong relational and psychological aspects tied to carpooling. Subjective perceptions – rapport with car mates, constraints to independence, and status as a passenger or driver – are more important than objective attributes: cost, convenience, and civic-mindedness (Oppenheim 1979). Strong ethnic ties within immigrant communities, for example, contribute to immigrants' propensity to carpool, increasing the likelihood that residents will travel to and from common destinations (Blumenberg and Smart 2014). These findings suggest an essential role for social capital connections and the likeliness to engage in activities which require it (Charles and Kline 2006).

Summary

In general, sharing economy business models, as an alternative and complement to the more common “reduce, reuse, recycle, repair” methods, pursue goals that can be summarized in the following four categories: redistribution and reuse, extension and maximization of the use of durable assets, exchange of goods and services, and sharing of productive assets.

Car sharing gives users the possibility to use the car only for the time it takes, which allows to reduce the number of cars in circulation, generating benefits at all levels. Increase in available parking spaces and reduction of harmful emissions improve the quality of life in the city with a significant contribution to the development of eco-sustainable mobility. Finally, eco-compatible and efficient vehicles augment compliance with safety and environmental impact standards.

Carpooling encourages people to get together with other people in their otherwise solitary commute time. This mode of transport is widespread in work or university environments, where different subjects, who travel the same route in the same time slot, spontaneously agree to travel together, sharing travel and maintenance costs extending the concepts of social networking application generating personal value and energy savings (Selker and Saphir 2010).

Education

Archie B. Carroll completed his academic training in full at the Florida State University (Tallahassee, Florida). He graduated with a bachelor degree in business administration in personnel management in 1965. He continued his studies in management and organizations and received his MBA in 1966. He completed his academic education with a doctoral thesis 6 years after completing his master's degree. His PhD in business administration (1972) also dealt with the topic of management and organizations. Before completing his PhD, he served as an assistant professor at Athens (Ala.) College (from 1966 to 1969) and as an instructor for the Florida State University College of Business (from 1969 to 1972) (Terry College of Business 2019).

Academic Career

After finishing his PhD, Archie B. Carroll took a position at the Terry College of Business at the University of Georgia. He remained working as a tenured faculty member in the Terry College of Business, serving the University of Georgia for 40 years in total (including 7 years of part-time employment) at the University of Georgia. Here, he progressed through the various stages of his academic career from the position of an assistant professor (1972–1975) to an associate professor (1976–1979) and finally to a full professor (1979–2005). In addition to his work as a professor, he served as an associate dean of the college (1979–1982) and as head of the Management Department (1995–2000). In 1986, Archie B. Carroll was awarded the Robert W. Scherer Chair of Management and Corporate Public Affairs. He held this position until his retirement in 2005. From 2001 to 2010, he taught in the GLOBIS Study Abroad Program of the University of Georgia and gave lessons in business ethics to students in Verona, Italy (Terry College of Business 2019; Idowu 2013). Archie B. Carroll retired from his full-time tenured position (2005) and became professor emeritus in 2006. Regardless of his retirement, he kept up his commitment as part-time director of the Nonprofit Management and Community Service Program (from 2000 to 2012).

During his academic career, he conducted research on the subject of CSR for decades. With the publication of more than 100 articles in leading management journals and over 20 books (including multiple editions of several ones), he contributed significantly to a broader understanding of CSR (Terry College of Business 2019). In addition to his teaching activities at universities (in USA and abroad), he also taught extensively in Executive Development Programs. Besides, he supervised PhD theses, served on graduate committees, and was a welcome speaker to business, government, and NGOs (Idowu 2013).

Even though retired for almost 15 years, he is still an active part of the academic world of CSR.

Major Contributions and Fields of Research

According to the website of Terry College of Business, University of Georgia, Archie B. Carroll's research interests are corporate social responsibility and performance, business ethics, stakeholder theory/management, sustainability, and nonprofit management/governance (Terry College of Business 2019). Carroll became devoted to these issues very early in his career. He joined the Social Issues in Management (SIM) Division of the Academy of Management in 1972 and became a chair of the SIM Division in 1976–1977 (Idowu 2013). Shortly after, he published his first book in the field “Managing Corporate Social Responsibility” (1977). In this publication, he focused on a number of management related aspects of CSR.

Two years later, Carroll published his most important theoretical article on “A Three-Dimensional Conceptual Model of Corporate Social Performance” (Carroll 1979). The conceptual model introduced in this article comprehensively describes essential aspects of corporate social performance. There are three aspects within the model which address major questions of concern relevant to academics and managers alike:

1. “What is included in CSR?”
2. What are the social issues the organization must address?
3. What is the organization's philosophy or mode of social responsiveness?”

(Carroll 1979, p. 497)

According to Carroll, a complete definition of social responsibility of business has to embody economic, legal, ethical, and discretionary categories. These four categories always simultaneously exist for business organizations (Carroll 1979, p. 499). More specifically, “any given responsibility or action of business could have economic, legal, ethical, and discretionary motives embodied in it” (Carroll 1979, p. 500). These ideas later formed the basis for Carroll's most influential article: “The Pyramid of Corporate Social Responsibility: Toward the Moral

Management of Organizational Stakeholders” (Carroll 1991), which has been frequently reproduced in top management and CSR journals (Visser 2006, p. 33). In this article, Carroll depicts his ideas of CSR into a pyramidal model that shows four responsibility categories, which in sum constitute total CSR: the four categories are:

1. Economic
2. Legal
3. Ethical
4. Philanthropic (Carroll 1991, p. 40).

Carroll emphasizes the importance of stakeholders and says that the stakeholder management perspective provides “not only a language and way to personalize relationships with names and faces, but also some useful conceptual analytical concepts for diagnosing, analyzing, prioritizing an organization’s relationships and strategies” (Carroll 1991, p. 48). The link between CSR and profitability was already explored before 1985. However, the research results could only be described as insufficient, either because they showed an ideological bias or were based on limited methodological procedures (Aupperle et al. 1985). By contrast, in the data-gathering study “An Empirical Examination of the Relationship between Corporate Social Responsibility and Profitability” (1985), the authors, by relating to Carroll’s definitions, developed an elaborate, forced-choice instrument. This instrument is one of the earliest accepted methods for measuring CSR among CEOs and according to Idowu, most frequently used in research studies up to the present day (Idowu 2013).

Carroll’s “Business & Society: Managing Corporate Social Performance” (1981) was one of the first books that emphasized the managerial/organizational dimension of the interdependence of business and society (Idowu 2013). The publication comprises four main parts, which focus on the business and society relationship (Part 1), external publics and issues, e.g., business and government, consumers or environment (Part 2), internal publics and issues, e.g., business, employees, and the individual, employment discrimination (Part 3), and finally deals with the question how to manage

corporate social performance, including information on social performance measurement, reporting, and communicating the social role of business (Part 4) (Carroll 1981). In this publication, Carroll elaborated on the ethical component to which he attributed a growing importance (Carroll 1999, p. 283). The book provided the basis for Carroll’s later publication “Business & Society: Ethics & Stakeholder Management” (1989), which is probably one of his most famous works. While he released the first three editions himself, he was joined by his colleague, Prof. Ann K. Buchholtz, (Rutgers business school, New York University) from the fourth edition onward, and Prof. Jill Brown (Bentley University) beginning with the tenth edition. It deals with the question how managers can balance and protect the interests of various stakeholders, including investors, employees, the community, and the environment successfully. It treats the linkage between business and natural, social, and financial environments. All three of them must be balanced in order to contribute to sustainability and future generations (Carroll and Buchholtz 2012). The book, as of late in its tenth edition, now runs under the title “Business & Society: Ethics, Sustainability & Stakeholder Management” (Carroll et al. 2018).

In addition to his articles on CSR (As of October 2019, Carroll’s articles have been cited 64,846 times according to Google Scholar (<https://scholar.google.com/citations?user=qMaIUAcAAAAJ&hl=en>), Accessed 21 October 2019), Carroll also dealt with the history of theory and research on CSR. His article on “Corporate Social Responsibility: Evolution of a Definitional Construct” provides a comprehensive overview of the evolution of CSR. Starting in the 1950s and ending up in the late 1990s, he shows how the understanding of CSR changed overtime (Carroll 1999). As of 2019, this article was still the most-read article in the previous 6 months in *Business & Society* journal. As an author, Carroll also contributed to the book “*Corporate Responsibility. The American Experience*” (Carroll et al. 2012), which documents the history of CSR in the US from the mid-eighteenth century to the modern day.

Engagement and Service

Apart from his academic commitment, Archie B. Carroll served in several organizations and institutions with a linkage to his research areas, e.g., as an active member in the Society of Business Ethics (from the 1980s onward), in which he served as a board member (from 1996 to 2001) and as a president (from 1998 to 1999) (Terry College of Business 2019). During his presidency he helped to bring together the Society for Business Ethics and the SIM Division of the Academy of Management (Idowu 2013), in which he also served as a board member (from 1975 to 1978), as Division Chair (from 1976 to 1977), and as a committee member for several awards (e.g., CSR Paper Award: 2011 until present; Buchholtz Mentor Award, 2017–2020). Moreover, Carroll was a board member of the Southern Management Association (from 1995 to 1998), chair of the Service Award Committee (from 2003 to 2005), and a member of the award committee (from 2016 to 2017). He was also a founding member of the International Association of Business & Society, for which he was in service from 1990 to 1993 as a board member.

Besides his engagement in the above-mentioned organizations, Carroll has served as a paper presenter, discussant and reviewer, author and editor of several journals (e.g., for the *Academy of Management Review*, *Journal of Management*, *Business and Society*, *Business Ethics Quarterly*, *Journal of Public Affairs*, *Sage Series in Business Ethics*, University of Georgia Press, and *Annual Editions: Business Ethics*) (Terry College of Business 2019).

Carroll also published a monthly column for the Athens Banner-Herald newspaper (from 1999 to 2008), in which he dealt with business ethics and CSR of common interest. Over 100 of these columns were published in the book *Business Ethics: Brief Readings on Vital Topics* (Carroll 2009).

Awards

Carroll, who has been a major contributor to the discussion about CSR over several decades, has won a variety of awards. His latest award is the

“Best Paper Finalist Award” from the journal “Business & Society” for his article “The Institutionalization of Corporate Social Responsibility Reporting” (Shabana et al. 2016). In 2016, he was awarded the Hunt SMA Sustained Outstanding Service Award by the Southern Management Association. He received the best book award by the Academy of Management, Social Issues in Management, in 2014 for “Corporate Responsibility: The American Experience” (Carroll et al. 2012). One of his most important recognitions was the first Lifetime Achievement Award in CSR, which was presented by the Institute of Management, Humboldt University, Berlin, Germany, in 2012.

Carroll was an elected Fellow of the International Association for Business and Society (IABS) (2011), the Academy of Management (2005), and the Southern Management Association (1996). He received the Distinguished PhD Alumni Award from the Florida State University College of Business in 2008. In 2003, he was awarded with the Distinguished Faculty Service Award of the University of Georgia, Terry College of Business. He was presented with the Sumner Marcus Distinguished Service Award in 1992 from the Academy of Management and, within the same year, the Distinguished Faculty Research Award from the University of Georgia, Terry College of Business (Terry College of Business 2019).

Summary

Archie B. Carroll is professor emeritus in the Terry College of Business, University of Georgia, USA. As a researcher, he significantly shaped the notions of corporate social responsibility (CSR) (Scherer and Patzer 2011, p. 322). His international recognition was advanced through the publication of his CSR Pyramid (Carroll 1991), which is probably the best-known model of CSR until today (Visser 2006, p. 33).

Cause Promotions

Katalin Ásványi

Synonyms

Fundraising; Sponsorship; Volunteer participation

Definition

Cause promotions are the use of company resources. The aim is to raise awareness of a case and to draw attention. It can be in a form of fundraising, volunteer participation, or sponsorship. The promotion of the case is directed by the company or may be associated with a similar activity. This is the costliest CSR activity in terms of resource use (Thomas and Sonal 2017).

Kotler and Lee (2005) distinguish six types of CSR along which a company can behave responsibly: cause promotion, cause-related marketing, corporate social marketing, corporate philanthropy, community volunteering, and socially responsible business practices. In the formulation of Kotler and Lee (2005), cause promotions is a method that gives companies the opportunity to fund, to contribute, and to show commitment to a particular cause.

While in the case of cause related marketing, the company implements its CSR activities through the sale of corporate products with the involvement of consumers, in the case of cause promotions, these solutions cannot be applied (Galan-Ladero and Valero 2013).

Chiagouris and Ray (2000) distinguish between cause promotions and advocacy advertising. “Cause promotions that promise a donation

to a cause based on a purchase of the company's product; and advocacy advertising of social issues that are sponsored by the brand" Chiagouris and Ray (2000, p. 50).

According to Arora and Henderson (2007), cause promotions programs can work more effectively than providing discounts.

Introduction

The purpose of cause promotions is convincing communication. It arouses interest in social affairs and raises awareness. Promotional strategies focus on external communication. The target audience is primarily stakeholders outside the company.

The following communication goals can be achieved through cause promotions (Kotler and Lee 2005):

- Raising awareness of the issue by presenting statistics and facts.
 - Convincing people to want to know more about the case.
 - Convincing people to sacrifice their time for the cause.
 - Persuading people to donate money.
 - Persuading people not to donate money but to donate in kind.
 - Convincing people to participate and be involved.
2. A donation with purchase is when a donation is made within a given time interval along each product sold. It is implemented in a specific amount, or as a percentage, which typically has an upper limit on the total amount of the donation. It is advantageous in that it can be well tracked by the number of sales, but ensuring transparency is often limited.
 3. Donation with a label or coupon redemption is accomplished by giving customers a code or label at the time of purchase that they can donate to in the store or by mail. That is, it expects additional activity from the consumer. This helps to measure the involvement of consumers, but at the same time it can be also deterrent to consumers.
 4. Donation with online activation, which, like the previous push, requires an extra energy investment from consumers. However, since all of this is requested online, this solution may be more convenient for them, but there is a risk that they will forget it.
 5. In the case of donation with consumer action, the donation is not related to the sale but to the consumer action, which in any case requires active consumers.
 6. The essence of the dual incentive method is the double incentive. That is, the company encourages consumers to increase their willingness to donate (e.g., a donation match). This provides an opportunity to form a partnership with the consumer, which also increases the loyalty of the consumer.
 7. In the case of consumer pledge drives, the company encourages consumers to act for a social cause or to cooperate with a nonprofit organization that requires localization.
 8. The buy one, give one (BOGO) method is a popular form of cause promotions campaigns in which a company does or gives a specific thing in exchange for selling a product. It is always attractive for consumers to see tangible results, but the problem of transparency can also arise here.
 9. The type of consumer directed donation is special in that it involves consumers in the

Types of Cause Promotions

Crocker (2021) distinguishes 10 types of cause promotions type CSR initiatives.

1. In the case of the "proud supporter" method, the company does not link the donation to the sale of a product or any other activity of the consumer, but makes a flat donation. As it is not tied to sales, it can take longer. However, in the absence of coercion to act, it only triggers passive consumer engagement.

decision to have a say on a list defined in advance by the company or even by designating their favorite organization to whom and how the company should make a donation. This will make the consumer more committed to the company and the perceived value will also be higher. However, this action is resource intensive if not just one but more nonprofit organizations are the beneficiary.

10. Volunteerism rally, this emphasizes the donation of time to consumers, that is, to volunteer, in return for which the company provides them with a free product or service as a reward. This makes it possible to implement and personalize local actions, but at the same time requires a high level of consumer commitment.

Advantages and Disadvantages of Cause Promotions

Cause promotions provides the following benefits to companies (Kotler and Lee 2005):

- Strengthening brand positioning.
- Creating a brand preference.
- Increasing the turnover.
- Building consumer loyalty.
- Increasing employee satisfaction.
- Developing partnerships.

However, there are also disadvantages to using cause promotions that companies should be aware of before choosing this form of CSR (Kotler and Lee 2005):

- Company visibility may be lost.
- It can only have a short-term effect.
- Tracking of investments and promotional investments is limited.
- It takes more time and involvement than a simple donation.
- The promotion is easy to repeat and copy and therefore the competitive advantage disappears.

Summary

To be successful, the following aspects should be considered when implementing the cause promotions action (Kotler and Lee 2005):

- Selecting a question that matches the product or company value.
- Being able to be committed by the management in the long run.
- Being of interest to the target market and consumers.
- Motivating employees.
- Having the ability to display media.
- Linking to the product during a campaign.
- Building partnerships.
- Incorporating brand visibility.
- Measuring and monitoring results.

Corporate issue promotions; Corporate social marketing; Corporate societal marketing; Passion branding; Pro-social marketing; Social issues marketing

Definition

One of the most expressive definitions that clearly links cause-related marketing to donation is: “Cause-related marketing is the process of formulating and implementing marketing activities that are characterized by an offer from the firm to contribute a specific amount to a designated cause when customers engage in revenue providing exchanges that satisfy organizational and individual objectives” (Varadarajan and Menon 1988, p. 60) Another approach to CRM is represented by Hawkes and Stead (1996) that CRM is “any marketing activity undertaken by a company designed to simultaneously benefit the company and the charity, or similar cause. The emphasis is on marketing” (p. 4). However, there are those who interpret it more broadly: “the general alliance between businesses and non-profit causes that provide resources and funding to address social issues and business marketing objectives” (Cui et al. 2003, p. 310), in that sense CRM can be an event sponsorship, it can also be related to volunteering or PR. (Duff 2003) Thus, the concept of CRM has expanded to mean that sales do not necessarily mean donations, and in Marconi’s (2002) formulation, CRM is a marketing practice that creates a mutually beneficial relationship with a product, service, brand, or company and a nonprofit organization, i.e., the relationship between the two stakeholders

should be mutually beneficial (File and Prince 1998; Papasolomou and Kitchen 2011).

Introduction

Cause-related marketing (CRM) is a specific form of corporate social responsibility (CSR) (Liu et al. 2010) or a type of CSR (Kotler and Lee 2005). CRM is part of CSR, but it does not fully cover CSR alone, meaning we cannot use the two terms synonymously (Rahman 2011).

CRM, however, is part of a marketing tool and marketing mix (File and Prince 1998), which was the fastest growing type in the early 1990s (Smith 1994). However, CRM is not the same as social marketing, it is definitely used to improve your company’s market position. Importantly, it is a tool in which a company and a case work together publicly. Kotler and Lee (2005) also distinguish between the two CSR solutions. CRM differs from strategic philanthropy (Adkins 1999) as the goal is not only to improve the social situation, but also to increase business success and profits, rather the primary purpose is much more commercial interest (Smith and Higgins 2000).

Mekonnen et al. (2008) call a new version of CRM affinity marketing with a long-term and discrete group orientation.

The Purpose of CRM

Cause-related marketing campaigns basically have two important goals. One is to achieve the social goal itself, such as alleviating global hunger, raising awareness, and supporting it. The other is important for the corporate side, increasing reputation, strengthening consumer loyalty, and increasing financial profits. The essence of CRM is to link the sale of a product or service to a social cause and the company donates a portion of the amounts sold to the case. So it applies to a particular product for a specified period of time and serves a particular organization or cause (Kotler and Lee 2005). Over the last 40 years, it has become a very common form of CSR. Collaboration benefits both companies and

nonprofits. There are few such solutions as CRM that reconcile social and commercial interests (Berglind and Nakata 2005).

Types of CRM

Basically, it is worth distinguishing between strategic and tactical CRM. In the case of tactics, we are only talking about a short-term marketing activity (Drumwright and Murphy 2001; Till and Nowak 2000), the primary goal is to increase revenue. In strategic CRM, top management is also actively involved, the company has significant resources invested and requires long-term commitment. Rather, the goal is to improve the company's long-term image and develop a positive consumer attitude toward the brand (Berger et al. 2007; Dowling 2001).

The two types differ mostly in four respects:

1. Matching the cause and the core competencies of the company (Pracejus and Olsen 2004), which in the case of strategic CRM means connecting with the core business.
2. The duration of the campaign (Till and Nowak 2000), typically 1 month for tactical ones, and it can be several years for strategic CRM.
3. The amount of resources invested (Macleod 2001; Welsh 1999), i.e., what the company spends on the case, is negligible in tactical CRM, typically around 1%, while in the case of a strategic solution it can be higher, up to 100%.
4. The degree of senior management involvement (Macleod 2001; Miller 2002) shows that managers are not involved in tactical CRM, while their involvement is considered particularly important in strategic CRM.

CRM can also be categorized based on the type of open economic relationship between the two organizations:

- Transaction programs, which, after the classic exchange-based donation, that is, after each unit sold, the company contributes a portion of the revenue to a social goal.

- Message promotion programs where the goal is promoted by the company but does not necessarily involve a transaction or financial contribution.
- Licensing programs, where a nonprofit adds its logo and name to a product and then receives a percentage of transactions.

However, in a broader sense, other forms of CRM can be implemented:

- For case-focused programs, the company selects a nonprofit on a strategic basis for a specific case with whom it enters into a partnership. They stand together for a cause, and that does not necessarily mean financial support.
- Business activity programs are linked to ethical business practices, raising awareness of the company's ethical business practices, but there is no specific donation (as fair trade products).
- Targeted programs, where a company helps its main market segment, which can take several forms: donations, volunteers, donations in kind and in cash or publicity.

Advantages of CRM

The following benefits can be seen from the side of companies:

- It helps the bottom line: it generates sales growth without additional investment (Varadarajan and Menon 1988).
- It helps the brand building: corporates choose issues that are of more interest to their consumers, thus expecting greater brand memory, preference, and purchase. Webb and Mohr (1998) showed that consumers value case-related brands more positively.
- It increases corporate reputation: popular cases also increase corporate popularity and are linked to the company name of the case.
- It generates goodwill: in times of crisis, wealth creation becomes even more important, consumers are less likely to leave socially

responsible companies, even if they have engaged in unethical practices (Creyer and Ross 1992), i.e., it is a long-term investment.

- It improves employee morale and retention, increases employee loyalty, creates satisfaction and pride in employees and owners: when choosing a job, 75% of respondents consider whether the company is committed to social issues where they want to work (Cone Communications 2002; Deloitte 2004; Kotler and Lee 2005), which confirms that CRM is worthwhile to apply for increasing employee loyalty.
- It gives credibility to the company as a non-profit organization.
- It provides a competitive advantage over other companies (Kooijmans 2004).
- It causes customer retention (Duff 2003).
- It helps to access market niches.
- It reduces consumer price sensitivity (Trimble and Rifon 2006).

From the side of nonprofit organizations, the following advantages are worth highlighting:

- The funding aspect is the most important and also the primary reason, i.e., it provides financial security for the organizations.
- Effectiveness of messages: however, delivering messages to consumers for their own benefit is also important; they can reach stakeholders, the company's partners, and customers much more easily.
- It also gives them marketing value, as the company carries out the promotion and the non-profit organization has no task.
- If the company manages it as an internal employee program, the employees can also be potential volunteers for the nonprofit organization.

Summary

The success of CRM can also be influenced by the design of the cause along different dimensions (Vanhemma et al. 2012):

- Type: primary need or secondary need/life saver or life enhancer.
- Scope: local, national, international.
- Acuteness: sudden disaster or ongoing tragedy.

The following are the challenges to consider when planning a CRM campaign:

- In order to be more than just an ad hoc campaign, it is necessary to involve top management so that the company has a lasting commitment to socially responsible operations. According to Drumwrights' (1996) research, managers are more actively involved in CRM campaigns than in a CSR initiative, with a higher personal commitment to the cause.
- The right fit between the goal and the company is essential, i.e., if the relationship needs to be explained, it is no longer appropriate.
- Creative solution is needed to fulfill the goal of the company and the organization; longer preparation, preliminary testing, concept creation, and open discourses are needed.
- It is worthwhile to develop a CRM code of ethics for transparency.
- Consideration and compatibility of the relationship between consumer preferences and the chosen goal can also help in the success of CRM (Vanhamma et al. 2012).
- Strategic CRM means higher evaluation in the eyes of consumers (Van den Brink et al. 2006).

The following questions should also be considered when starting this type of campaign:

- Is CRM just a diversionary tactic or is it really a good cause?
- Is it only one product problem that becomes hidden in PR?
- Is the amount offered disproportionately small compared to the increase in sales of the product it generates? Is it a win-win situation or just the corporate win from the cooperation? Does the company just take advantage of the nonprofit?
- Is it just manipulation or real social impact?

- Are the two interests compatible, does the company not influence the goal too much?
- How transparent is the campaign?

Definition

The Coalition for Environmentally Responsible Economies (CERES) is a nonprofit organization based in the USA which comprises investors, environmental and religious organizations, public pension trustees, and public interest groups. Smith (1993) clearly pointed out that CERES provides a broad consensus among different groups of interests such as environmental activists, investors, community, and so on. Given the diversity of members that have promoted the CERES coalition, the adoption of CERES principles leads to the promotion of different community interests in a more inclusive way than other associations focused on an industry or commerce level. Thus, CERES is a coalition of investors, firms, and environmental organizations. The coalition's purpose is to promote investment policies that are environmentally, socially, and financially sound. In other words, the goal of the members of the CERES coalition is to reinforce, increase, and guarantee the corporate environmental responsibility through the selective use of investment capital (Smith 1993). There are currently more than 70 members, including large financial organizations such as Harrington Investments and environmental groups such as the Sierra Club (https://www.iisd.org/business/tools/principles_ceres.aspx). As Smith (1993, p. 313) clarified, “although CERES developed the principles in the United States and has mainly sought

endorsements by U.S.-based companies, the coalition recognizes that environmental accountability problems do not end at U.S. borders. The CERES Principles are designed to be applied worldwide, in industrialized nations and in developing nations.”

Introduction

Within the environmental sphere, companies now have to consider climate aspects as an economic factor in their business strategy, including gathering and reporting and disclosure of environmental issues, concerns, and strengths. According to Freedman and Jaggi (2011), reporting acts as a means to increase transparency, informing stakeholders about corporate actions and strategies related to environmental issues such as climate change. A high degree of environmental information transparency reveals a firm’s strategy, which allows interest groups to monitor and seek improvement in the firm’s operations (Sroufe 2003; Kolk et al. 2008). As Woodall, Vice President for Environmental Policy for the Southern Company, pointed out in 1992, firms have begun to be critical in their thinking about the value of a company associated with the disclosure of environmental information.

The proactively climate change actions identified by a firm in its voluntary disclosure reports could aid rivals in competing with the disclosing firm. These climate change activities serve as a driving factor in reducing costs, achieving operational efficiency, and improving productivity because they allow the firm to attract better talent and motivate employees (Edmans 2011). Moreover, companies that opt to disclose information beyond the standard requirements reduce the information risk or increase the investor following, resulting in benefits such as a reduction in capital and debt costs or an increase in the market value of the company (Barry and Brown 1984). Thus, a voluntary disclosure policy would primarily reduce information asymmetry by assisting investors in evaluating the ethical and environmental practices and their relationship with climate change actions and activities. In addition, it

may enhance capital market participants’ perceptions of the company from the positive association of being a growth-sustainable organization aware about climate change, a reputation that translates into increased sales.

Overall, as a consequence of the sharp rise in concern with environmental topics, there has recently been an increase in the need to know how companies, governments, and society at large all over the world should confront this problem, which has repercussions at both national and international levels. In this line, and as Cogan (2006, p. 1) pointed out, “companies as the vanguard no longer question how much it will cost to reduce greenhouse gas emissions, but how much money they can make doing it. Financial markets are starting to reward companies that are moving ahead on climate change, while those lagging behind are being assigned more risk.”

At this regard, the Coalition for Environmentally Responsible Economies (CERES) emerges as a non-profit organization based in the USA which comprises investors, environmental and religious organizations, public pension trustees, and public interest groups. Smith (1993) clearly pointed out that CERES provides a broad consensus among different groups of interests such as environmental activists, investors, community, and so on. Given the diversity of members that have promoted the CERES coalition, the adoption of CERES principles leads to the promotion of different community interests in a more inclusive way than other associations focused on an industry or commerce level. Thus, CERES is a coalition of investors, firms, and environmental organizations. The coalition’s purpose is to promote investment policies that are environmentally, socially, and financially sound. In other words, the goal of the members of the CERES coalition is to reinforce, increase, and guarantee the corporate environmental responsibility through the selective use of investment capital (Smith 1993). There are currently more than 70 members, including large financial organizations such as Harrington Investments and environmental groups such as the Sierra Club (https://www.iisd.org/business/tools/principles_ceres.aspx). As Smith (1993, p. 313) clarified, “although CERES

developed the principles in the United States and has mainly sought endorsements by U.S.-based companies, the coalition recognizes that environmental accountability problems do not end at U.S. borders. The CERES Principles are designed to be applied worldwide, in industrialized nations and in developing nations.”

CERES “environmental members” include Green Seal, the Sierra Club, Valdez Society of Japan, Earth Island Institute, the International Alliance for Sustainable Agriculture, and the Worldwide Fund for Nature. “Social investment members” include the United States Trust Company of Boston, Harrington Investments, Parnassus Fund, Social Responsibility Investment Group, Calvert Social Investment Fund and Foundation, and the Presbyterian Church. Note, even more, that large members are organizations and individuals whose interests are not represented by the other members of the Coalition. They include the Industrial Union Department, the Jessie Smith Noyes Foundation, and the Washington Office on Environmental Justice.

From the beginning of the coalition, there were numerous interventions that clearly defended and claimed the need for CERES. Harrison J. Golding who was Comptroller of New York City clearly pointed out: “We hope corporations come to recognize that environmental considerations are among the most essential to the corporate policy-making process. Hence, our guidelines are in no way weapons of coercion. . . . Rather, at this point the Principles will serve merely as a starting point from which corporations can help us develop a workable approach to environmentally responsible corporate policy making.” Meanwhile, for one of the chairs of the Sierra Club, Mike McCloskey: “The time is right for corporations and environmentalists to deal directly with each other and not filter everything through government. The companies that sign the CERES Principles identify themselves as ones that organizations like mine should approach in our desire to forge a new relationship.”

In detail, CERES is a sustainability nonprofit organization working with the most influential investors and companies to build leadership and drive solutions throughout the economy. Through

powerful networks and advocacy, CERES tackles the world’s biggest sustainability challenges, including climate change, water scarcity and pollution, and human rights abuses. Overall, its mission is transforming the economy to build a sustainable future for people and the planet. Specifically, CERES advances leading practices that ramp up global investments in clean energy and sustainable food and water. It also set the highest bar for sustainability leadership for Fortune 500 firms and other influential companies. It delivers cutting-edge research and innovative tools to educate and inspire leaders across every sector of the economy to take action. And it mobilizes investor and company leaders to advocate for stronger climate, clean energy, and water policies at the state and federal level.

In 1989, CERES announced a set of several principles for ensuring and heightening the corporate environmental responsibility. In their website and several annual reports, CERES specifies that it is based on a set of ten key principles; the ten so-called CERES principles offer guidance and standards against which companies can measure their performance on environmental and social issues. For Statman (2007), the CERES principles link corporate environmental responsibility with the bottom line while covering environmental protection, resource conservation, risk reduction, product safety, public access to information, and accountability. The ten principles commit companies to protecting the Earth, using energy and resources wisely and sustainably, minimizing waste, and selling safe products and services. The signatories back up their commitment by pledging to reduce risk, disclose hazards, and compensate for damages. They also agree to provide high-level management support for environmental activities, and to gather and disseminate information about their environmental performance, both internally and externally. For Smith (1993, p. 311), the CERES principles recognize that sustainable use of national resources is ultimately necessary for corporate survival. Furthermore, as an externally developed mechanism, the CERES principles must be internalized through the signature of the organizations of these principles, on a voluntary basis; this makes the

environmental concerns and issues in one of the top priorities of a corporation (Smith 1993). It must be highlighted that the CERES principles are entirely voluntary.

Organizations that voluntarily sign the principles proposed by CERES assume the responsibility of annually disclosing a report on the annual progress in the implementation and development of these principles. Therefore, these organizations that voluntarily sign CERES principles confirm their intention to be reference organizations, leaders, in the disclosure of their environmental performance in a standardized manner. For Smith (1993), one of the benefits associated with the standardization of environmental performance reports is that it allows investors to evaluate and analyze the environmental impact and performance of a firm; this evaluation will be useful in the decision-making process.

As Smith (1993) points out in his research on the CERES principles, they develop a unique approach and vision on the environmental responsibility of an organization that differs from the traditional system of legal sanctions. Justify your claim with a series of arguments. First, the author points out that the principles act as the necessary tool to guarantee environmental responsibility and accountability from an ethical point of view and complement government regulation. In the second place, the CERES principles represent a broad consensus among the population. Third, these principles standardize the practice of disclosure of environmental information. Fourth, the principles are applicable to all national and international organizations regardless of the sector of activity.

Specifically, the ten CERES principles that this coalition points out in its website and numerous reports are the following:

1. Protection of the biosphere

The aim of CERES is to minimize and strive to eliminate the release of any pollutant that may cause environmental damage to air, water, or Earth or its inhabitants. CERES aims to safeguard habitats in rivers, lakes, wetlands, coastal zones, and oceans and minimize contributing to the greenhouse effect,

depletion of the ozone layer, acid rain, or smog.

2. Sustainable use of natural resources

The aim of CERES is to make sustainable use of renewable natural resources, such as water, soils, and forest. CERES will conserve nonrenewable natural resources through efficient use and careful planning and protecting wildlife habitats, open spaces, and wilderness while preserving biodiversity.

3. Reduction and disposal of waste

The aim of CERES is to minimize the creation of waste, especially hazardous waste, and wherever possible recycle materials. CERES will dispose of all wastes through safe and responsible methods.

4. Wise use of energy

CERES aims to make every effort to use environmentally safe and sustainable energy sources to meet our needs. The aim of CERES is to invest in improved energy efficiency and conservation in members' operations and maximize the energy efficiency of products that their members produce and sell.

5. Risk reduction

The aim of CERES is to minimize the environmental health and safety risks to its employees and the communities in which its members operate by employing safe technologies and operating procedures and by being constantly prepared for emergencies.

6. Marketing safe products and services

The aim of CERES is to sell products or services that minimize adverse environmental impacts and that are safe as consumers commonly use them. CERES will inform consumers of the environmental impacts of its members' products or services.

7. Damage compensation

CERES aims to take responsibility for any harm that its members cause to the environment by making every effort to fully restore the environment and to compensate those persons who are adversely affected.

8. Disclosure

CERES will disclose to its employees and to the public incidents relating to its member's operations that cause environmental

harm or pose health or safety hazards. At this regard, CERES aims to disclose potential environmental, health, or safety hazards posed by its operations. Moreover, CERES will not take any action against employees who report any conditions that create a danger to the environment or pose health or safety hazards.

9. Environmental directors and managers

Specifically, at this respect, CERES points out that it will continue to improve management resources to implement the CERES principles. This includes monitoring and reporting its implementation efforts and sustaining a process to ensure that the board of directors and chief executive officer are kept informed of and are fully responsible for all environmental matters. CERES will establish a committee of the board of directors with a responsibility for environmental affairs. At least one member of the board of directors will be a person qualified to represent environmental interests to come before the company.

10. Assessment and audit

The aim of CERES is to conduct and make public an annual self-evaluation of its progress in implementing these principles and in complying with applicable laws and regulations throughout the worldwide operations of it and its members. CERES aims to work toward the timely creation of independent environmental audit procedures that it will complete annually and make available to the public.

The truth is that over the last decades, numerous organizations and entities have voluntarily disclosed environmental reports. However, the target audience for these reports has not been able to assess them clearly, with knowledge, in part due to the absence of standardization. The reports have not been comparable on many occasions because they contain different types of information, both qualitative and quantitative (Clarkson et al. 2008).

In addition to this lack of homogeneity, there was also the lack of credibility and trust in the

information contained in these voluntary reports. Therefore, one of the main benefits of CERES with respect to the issuance of previous voluntary reports is standardization, which has an effect on a higher level of homogenization (Smith 1993). This standardization allows each organization adhering to the CERES principles to answer the same questions in the same format, in such a way that they provide information about environmental concerns, strengths, and issues in standardized terms. These questions are intended to know and assess the degree of adherence of the entity to the aforementioned principles.

In sum, by adhering to CERES principles, organizations aim to voluntarily affirm and disclose their commitment and compromise to environmental responsibility; they must promote activities, actions, and strategies according to the responsible stewards of the environment, protecting also the Earth (Smith 1993).

Summary

The Coalition for Environmentally Responsible Economies (CERES) emerges as a non-profit organization based in the USA which comprises investors, environmental and religious organizations, public pension trustees, and public interest groups. CERES is a coalition of investors, firms, and environmental organizations. The coalition's purpose is to promote investment policies that are environmentally, socially, and financially sound. Overall, its mission is transforming the economy to build a sustainable future for people and the planet. CERES specifies that it is based on a set of ten key principles; the ten so-called CERES principles offer guidance and standards against which companies can measure their performance on environmental and social issues. The CERES principles must be internalized through the signature of the organizations of these principles, on a voluntary basis. Organizations that voluntarily sign the principles proposed by CERES assume the responsibility of annually disclosing a report on the annual progress in the implementation and development of these principles.

[Organizational change](#)

Definition

Coupled with the accelerating technological advancements, global competition, and the transformations in human capital, organizations are prompted to undergo a continuous change (By 2005; Kotter 1996). Despite the ample research in the literature, change still is the representation of a management challenge for practitioners and scholars (Suddaby and Foster 2017). There is still no clarity in the conceptualization of the construct, which leads a lack of consensus on the definition of change management (Suddaby 2010). However, in general, change management is the reflection of a process that aims to modify an organization's strategy, structure, procedures, and capabilities in order to adapt to the external environment (Moran and Brightman 2000).

Introduction

In today's extensively aggressive and continuously changing environment, where the change has turned into a norm for both private and state organizations to survive, managing the change has become the major tasks of managers (By 2005). Organizational change is an undeniable feature of organizations' lives at operational and strategic level (Burnes 2004; D'Aunno et al. 2000). In this regard, an organization's ability to identify its desired state and to manage the change process in order to reach that desired state is of importance, correspondingly, change management is usually viewed as a crucial managerial skill (Harigopal 2006; McCauley 2006). Although the necessity of organizational change is indisputable with contemporaneous dynamic patterns taken into account, engaging in sustainable changes potentially harbors a number of complicated adverse effects (Stouten et al. 2018). The difficulties of operating in a hyper-turbulent environment entail organizations to learn and adopt new approaches for renewal. In this domain, organizational agents are exposed to adopt a change management approach to cope with the changing process. Therefore, successful change management has been the focal point of organizations (Ashurst and Hodges 2010). Thus, organizations are continuously endeavoring to align their business activities with the requirements of rapidly changing external environment (March 1981; Moran and Brightman 2000).

According to the metaphor of organizational life, organizations are open systems that are adaptive and living (Morgan 1986). Organizations adapt in a way that the external environment favors them to achieve success. Despite the numerous perspectives and methods that have been proposed to cope with change, the existing literature lacks a consensus on the most appropriate change method for organizations (Bamford and Forrester 2003) since every organization may need or follow a different approach based on their contingencies; therefore, suggestion of a directive change is not appropriate for organizations (Burnes and Jackson 2011; Michel et al. 2013; Nyström et al. 2013). Organizational

changes can include mergers, establishment of a new department, downsizing, adoption of new technologies, implementation of new procedures, changes in product or service lines, and alterations in production systems (Lines 2005). Although the literature provides a significant number of change methods, majority of the organizations that undergo change fail (Al-Haddad and Kotnour 2015; Burnes 2009; Burnes and Jackson 2011; Gill 2003; Michel et al. 2013; Sirkin et al. 2005).

The fundamental and solid basis of change management traces back to the initial work of Kurt Lewin with his focus on organizational development that is so called as "*the planned change approach*" (Cummings et al. 2016; Todnem 2005). Although there is no universally accepted practical view to organizational change, planned organizational change tries to clarify what kind of transformations organizations need to experience and how they implement the change (Burnes 2004; By 2005). The planned change approach proposes the three major steps of organizational change including "*unfreeze, change, and freeze*" (Lewin 1952; Sonenshein 2010). These sequential prescriptive steps aim to advise the managers about how to manage organizational change. In this vein, unfreezing reflects the change in an organization's vision with a change plan to implement. The unfreezing step prepares the organization for adoption of new organizational systems. Lastly, the change step includes the modification of existing systems including policies, procedures, and structures. In the last step, the change is consolidated across the organization. The planned organizational change underlines the significance of comprehending the different states that organizations experience while moving from current to desired state (Eldrod II and Tippet 2002; Stouten et al. 2018). The planned change management approach of Lewin with this three-step approach has dominated and initiated the further change views in the literature (Levasseur 2001; Michaels 2001). The further change approaches were developed following the Lewin's approach of change (e.g., Beer 1980; Hiatt 2006; Judson 1991; Kanter et al. 1992; Kotter 1996).

Despite the ample support, the planned approach has been the center of critics as it assumes that all organizational members are willing to change, which is usually an exceptional case, as individuals and groups can have different opinions (Bambford and Forrester 2003). In conjunction with this view, due to the highly volatile environments and high levels of uncertainty, employees in an organization can never experience the refreezing state (Mack et al. 1998). The dominant understanding lying behind the planned change view is that change agents are the ones who are responsible for timing and planning the change (Burnes 2004). However, changes can emerge without the managers' intention instead through a situational momentum which is considered as the contextual factors that drive organizational change (Jing and Van de Ven 2014). As organizations are highly connected with the entities residing in their external environment, the internal organizational practices and mechanisms are shaped by these external forces (Pfeffer and Salancik 2003). Therefore, all organizations are exposed to their environmental conditions, which indicates that even planned change is not without external contingencies. In addition, the planned organizational change entails ambiguity and involves the organizational members, their interests and goals that can create conflict. In addition, some authors assert that the planned approach reflects a bounded process where change management is an ongoing process (Oswick et al. 2005).

While there are other typologies of organizational change in terms of how change happens, the emergent change is viewed as the other dominant approach for change (By 2005). The emergent view of change stresses the perspective that change is not a combination of linear events that happen in a certain time of period, it is a continuous process for adapting to the changing environment (Burnes 2004; Oswick et al. 2005). Caldwell et al. (2004, p. 77) defines emergent change as “*a long-term complex and incremental process of shaping how change unfolds over time.*” Drawing with this notion, the emergent approach to change points out the unforeseen nature of change.

According to Burnes (1996, p. 14), emergent approach emphasizes “*extensive and in-depth*

understanding of strategy, structure, systems, people, style and culture, and how these can function either as sources of inertia that can block change, or alternatively, as levers to encourage an effective change process.” The core idea behind the emergent change is that identifying and implementing a linear combination of actions is not possible for rapid and complex changes (Todnem 2005). According to the supporters of emergent view, the planned change is not appropriate to implement in complex and uncertain environments and change should be considered in a holistic and contextual manner (Mintzberg and Westley 1992; Todnem 2005). Therefore, emergent perspective advocates that success in change is more dependent on initiation of change, communication, and understanding of issues at organizational level rather than specified steps (Pettigrew 1997). In this vein, the emergence of change proposes that it is not possible for top management to identify and make an implementation of every action for change. Moreover, during the change process, the senior managers adopt a facilitator role of change rather than a controller one. Therefore, emergent change points out the initiation steps before change happens rather than the specifically set steps to change (Burnes 2004, 2009). The prominent emergent change models are developed by Kanter et al. (1992), Kotter (1996), and Luecke (2003) in which they point the role of leaders as an initiator and facilitator of change by developing a shared vision and communicating the vision of change within the organization and emphasize the role of organizational members at the lower level rather than a top-down change process (Todnem 2005). Correspondingly, emergent approach puts more emphasis on the extent that an organization is ready for change and the managers' role in facilitating the change within the organization (Burnes 2004).

In addition to the typology of emergent and planned change, there is another basic conceptualization of organizational change which depends on the rate of occurrence (Todnem 2005). In this vein, Tushman and Romanelli (1985) propose the punctuated equilibrium model which represents the discontinuous change. In discontinuous change, an organization experiences incremental

changes that are interrupted by radical changes. Grundy (1993, p. 26) asserts that organizations undergo rapid changes which can encapsulate fundamental strategic, cultural, and structural changes in discontinuous change. Compared to discontinuous change, in continuous change, organizations can continually adapt to the environment to keep pace with the environmental changes (Burnes 2004; Luecke 2003).

Despite the approaches proposed for change management, Dunphy and Stace (1993, p. 905) assert that *“managers and consultants need a model of change that is essentially a ‘situational’ or ‘contingency model’, one that indicates how to vary change strategies to achieve ‘optimum fit’ with the changing environment.”* In addition, according to Bamford and Forrester (2003), it is not possible to label any model as “one best way” and there is no clarified best way to manage organizational change. Therefore, it is crucial for managers to comprehend their aim, their internal strengths and weaknesses, and the contextual factors in which the organization operates. Every organization may follow a different approach depending on their size, structure, industry, or environmental circumstances.

Related Issues

Organizational change entails leadership efforts to introduce the required new behaviors for change. Leaders are the ones who are responsible for creating the appropriate environment for the organizational members in order to implement the change (Burnes 2011). Leaders play a critical role in creating organizational readiness and improving adaptability of employees for the change. According to Gill (2003, p. 307), it is the leaders who make a difference in the success of organizational change which *“must be planned, organized, directed, and controlled.”* Gill (2003) asserts that successful organizational change requires a culture with shared values that can promote the communication and understanding of change for strategy and vision through empowerment, motivation, and inspiration of the organizational members.

Although organizational change is crucial for organizational survival (Kiesebach et al. 2009), it can accompany some implications at individual level (Vakola et al. 2013) such as increase in turnover intention, anxiety (Holt et al. 2007; Rafferty and Griffin 2006), decrease in productivity and job satisfaction (Mack et al. 1998; Rafferty and Griffin 2006). Therefore, the ability of leaders to manage the change is of importance. Leader behaviors can impact the wellbeing of subordinates during organizational change, as they are the role models or facilitators of change (Kiesebach et al. 2009). Accordingly, if the management of organizational change is carried out in an informative, fair, and participative manner, the change can garner more positive reactions including acceptance and embracement of change (Armenakis et al. 2007; Oreg et al. 2011). In this vein, leaders can shape the change process in a way that can conduce the subordinates to accept the change. Especially, transformational leaders can stimulate subordinates to perform beyond what is expected, promote communication of organizational goals, provide guidance, and bridge multilevel processes including individual, team, and organizational level, all of which lead successful management of organizational change (Bass 1985; Bass and Riggio 2006; Feng et al. 2016; Holten and Brenner 2015).

Successful leaders need intellectual and cognitive abilities to process crucial information for solving problems, rationalizing the possibilities, and making decisions. Moreover, the spiritual abilities of leaders build a bridge between the organizational members and the company by communicating the meaning of their efforts (George 2001). Emotional intelligence provides leaders to benefit from who they are rather than the power of their position or authority (Gill 2003). The behavioral skills encompass verbal and nonverbal communication within the organization. These abilities are important to communicate effectively and build a strong shared vision, which are considered as the key ingredients of successful organizational change (Armenakis et al. 1993). In essence, effective communication enables the inspiration and adaptation of employees towards change and persuasion to

accept the change. Employees' commitment and cooperative behaviors are vital for organizational change (Porras and Robertson 1992). In addition, through empowerment, leaders can build trust with their employees and eliminate the barriers for creative, risk-taking, and innovative behaviors of employees (Kotter 1996). It is crucial that organizational members are cognitively, emotionally, and behaviorally ready to accept and adopt the change, which indicates the extent of organizational readiness for change (Armenakis et al. 1993, 2007; Weiner et al. 2008). Successful organizational change entails required resources including "budget, systems, time and information, and the necessary expertise, knowledge, and skills" (Gill 2003).

In terms of barriers to change, organizations' strategic and structural inertia behaviors can rise due to their past experience since organizations are bounded with their existing systems, which acts as a barrier to change and also as a cause to the death of organizations (Hannan and Freeman 1984; Huang et al. 2013) as organizational inertia inhibits the adaptation of organizations to their external environment (Chesbrough 2007). Especially, organizational inertia can restrict innovation capabilities of organizations that are important for organizational adaptation (Huang et al. 2013). In addition, although firm capabilities are important for organizational change such capabilities can create competency trap for organizations as well. For example, organizational learning can provide organizational success; however, a competency trap can emerge when successful outcomes are achieved by existing procedures and experience that blinds the organization to explore for new procedures, systems, and competencies. Thus, the organization can become incapable of changing and adapting to the external environment (Hannan and Freeman 1984; Levinthal and March 1993; March 1991).

Summary

In today's hypercompetitive global environment, change has become a sine qua non for

organizations. Organizations need appropriate policies, practices, culture, systems, and adequate resources and capabilities to experience successful organizational change in order to adapt to the external environment. The contextual factors can affect the appropriate change process that suits organizations; therefore, there is no one best way for organizational change. In conjunction with aforementioned statements, organizational change can be smoothly implemented when the stakeholders' and organization's goals are in alignment. In essence, as employees are the actual players in the implementation process of change, it is important to provide direction and motivate them to accept the change that can help to avoid breaking psychological contracts.

Effective leadership; Positive leadership; Transformational leadership

Definition

There are several approaches to leadership and management, based on different assumptions and styles. The latter can be grounded on a combination of personal and organizational attributes of tangible and intangible nature, such as charisma. Visioning, empathy, and empowerment are all components of charismatic leadership.

Charisma is a unique type of influence in which followers believe their leader possesses exceptional qualities, such as effective communication, vision, trust, and impression management (Bell, 2013). Personal responsibility, integrity, responsibility, and solidarity are typical characteristics of charismatic leaders (Becker, 1998) who help organizations foster a virtuous corporate culture in organizations (Bruni & Sena, 2013; Cardona, 2000).

Charisma has been identified as an essential component of transformational leadership

(Jacobsen & House, 2001). Transformational leadership components include charisma, intellectual stimulation, and individualized consideration (Avolio et al., 1999; Bass, 1985; Bass & Avolio, 2000; Waldman et al., 2006). Charisma “provides followers with a clear sense of purpose that is energizing, a role model for ethical conduct, and builds identification with the leader and his or her articulated vision” (Avolio et al., 1999, p. 442).

Charismatic leadership takes on socialized and personalized forms. The latter can have and bring negative or positive connotations and implications. Along with numerous positive examples (e.g., Ghandi, Yunus, or Saint Francis), there are charismatic leaders throughout history who have had disastrous consequences for their followers, institutions, and organizations. Socialized charismatic leadership, on the other hand, motivates followers to maximize organizational goals.

Introduction

Over the last few decades, several leadership theories “referred to as charismatic, transformational, visionary, purpose-driven or inspirational, has emerged in the organizational and managerial literature” (Shamir et al., 1993, p. 577). According to the theories mentioned above, “leaders transform the needs, values, preferences and aspirations of followers from self-interests to collective interests. Further, they cause followers to become highly committed to the leader's mission” (Shamir et al., 1993, p. 577). Theories of charismatic leadership contend that a variety of leadership behaviors shift followers from an individual-oriented, hedonistic, rational-economic mode of operation to a collective, moral, and value-oriented approach (Shamir et al., 1993).

Several empirical studies have found that leaders who engage in charismatic behaviors elicit higher performance ratings and more satisfied followers. As a result, they are regarded as more effective in positions of leadership than others. According to Burns (1978) and Bass (1985), charismatic leaders elevate followers' needs due to their ability to allow followers transcend their own self-interests (Bass, 1985; House, 1977).

Charismatic leaders raise followers to “more principled levels of judgment” (Burns, 1978).

Shamir et al. (1993) argue that charismatic leaders motivate their followers through the following drivers: increasing the intrinsic valence of effort; increasing effort-accomplishment expectancies; enhancing the intrinsic valence of goal achievement; instilling faith in a better future; and creating personal commitment. The valence of efforts is increased by emphasizing symbolic aspects based on key values encompassing moral statements. Indeed, charismatic leaders emphasize the links between efforts and values and improve followers' self-worth and self-esteem by expressing confidence in their ability to meet such expectations (Yukl, 1989). Charismatic leaders articulate a values-based vision and a values-driven mission that increase the intrinsic valence of goal accomplishment by presenting goals in terms of the values embodied in the vision and mission. In this regard, the charismatic motivational influence in enhancing commitment to a common vision underpinning transcendent goals is critical (Bennis & Nanus, 1985; House, 1977). Charismatic leaders de-emphasize extrinsic reward expectations. “The rewards involved in the charismatic leadership process include self-expression, self-efficacy, self-worth and self-consistency, which emerge from the process” (Shamir et al., 1993, p. 583).

Attention should also be addressed to the organizational conditions for charismatic leadership. When the organizational task is closely related to dominant social values to which potential followers are exposed, charismatic leadership is more likely to emerge and be effective, especially in exceptional circumstances and/or extraordinary conditions that call for changes to tackle with unforeseen circumstances and require exceptional efforts or sacrifices (Brown, 2011; Martin, 2002; Olsen, 2010).

Key Issues

Among the two major traditions of study on charisma (Jacobsen & House, 2001), the former is

sociological-based and stems from Weber (1922). “This stream of studies addresses the social conditions under which charismatic leadership appears and the contingencies in which personal charisma will/will not be routinized into a stable social order” (Jacobsen & House, 2001, p. 76). The latter is psychologically based and focuses on the personal characteristics of charismatic leaders such as visioning, empathy, and empowerment (Choi, 2006). Leaders who express themselves with passion, motivation, emotional, and inspirational are likely to transmit charisma to the followers (Yukl, 1999 and 2010).

Charismatic leaders create a vision that informs employees about the organization's goals. The vision is integrated into the organization's day-to-day operations through the alignment of the leader's actions with the values advocated in the vision.

Empathy is the ability to understand another person's motivations, values, and emotions. It entails mutual trust and may result in relationship-oriented leadership behavior (Bell, 2013). Followers are attracted by relationship-oriented leaders (Ehrhart & Klein, 2001), who motivate them to perform better than expected by helping them acquire self-actualization (Yukl, 1999).

Empowerment allows leaders to make followers feel powerful and capable to achieve goals and develop their sense of self-efficacy. Charismatic leaders can empower their followers in a variety of ways, such as by establishing clear goals and tasks.

A charismatic leader's qualities also include integrity and effective communication (Conger et al., 2000). On the one hand, leaders must demonstrate integrity by being consistent between organizational values and personal actions. On the other hand, they should display courage to manage the followers' impression and effectively communicate their convictions.

Finally, the situational context - defined as the current situational realities - influences the leader's charisma. A conceptual integration among three main factors - the leaders, their attributes, and the social situation in context - has

been provided by Jacobsen and House (2001), addressing attention to the phases included in the process from the rise of a leader to the achievement of a socialized leadership (Palshikar 2007).

Summary

To face increasingly complex contexts, organizations need people equipped with hard and soft skills and must seek to create an organizational environment that provides them with empowerment, sense of responsibility, and trigger their capability to contribute to achieve the organizations' goals through an appropriate leadership style, according to the situational context. In this vein, charismatic leaders are transformational, as they arouse inspirational motivation, provide intellectual stimulation, and treat followers with individualized consideration (Avolio & Bass, 1987), driving them to reach their full potential, generate higher levels of performances, and achieve the company's goals.

Introduction

The Chartered Institute of Marketing, or CIM (CIMA), is the largest professional body for marketing in the world, with a membership that reached over 30,000 members (Wikivisually, 2020). It is a British Council qualified association based in the UK. It offers professional marketing

related qualifications together with training for achieving them.

CIM's primary focus is to set and maintain professional standards for the marketing and sales profession and to develop the skills and knowledge of its members to achieve those standards.

History

According to CIM (CIMb), in 1911, 12 sales managers met up in a London hotel and agreed to set up the organization that eventually became known as CIM. Their common goal was to professionalize the field of selling. Hence, they named the organization as Sales Managers' Association. Its overarching aim was: "To promote, encourage and coordinate the study and advancement of sales management in all its branches." The association, which by 1921 became known as the Incorporated Sales Managers' Association (ISMA), formed affiliations with the American National Association of Sales Managers and the Associated Advertising Clubs of the World in 1922. By 1924, they formed the first branch of the organization in Manchester and held their first conference in Buxton on 27–28 May. In 1927, the association set up its benevolent fund, which started supporting charities such as the London Orphan School. By 1928, the first annual Certificate examinations were held. Two decades later, in 1956, the Association was instrumental in helping set up the European Contact Group of Sales and Marketing Associations, which later (in 1965) became the European Marketing Council.

Following further years of developments, including achieving successive patronage from King George VI, the HRH the Duke of Edinburgh until the current Patron the Prince of Wales, the association decided to change its name to the Institute of Marketing and Sales Management in 1961. In 1963, a boost to the field of marketing was provided as part of "National Productivity Year." This was reflected at a special luncheon when both HRH the Duke of Edinburgh and Prime Minister Harold Macmillan highlighted the importance of marketing as a decisive element

for improving and supporting UK business performance. In 1968, the Institute of Marketing and Sales Management was finally changed to the Institute of Marketing. In 1971, the headquarters of the Institute was moved from Holborn, in central London, to a nine-acre site at Moor Hall, Cookham, Berkshire. In the same year, various Marketing Interest Groups (MIGs) were set up to reflect marketing issues in their respective industries. In 1973, the first code of practice was adopted by the Institute. It requires all members to observe its provision under the term of the constitution. In 1976, perhaps one of the most enduring marketing definitions was approved by the Institute as follows: "Marketing is the management process responsible for identifying, anticipating and satisfying customer requirements profitably." Almost half a century later, this definition is still widely referred to.

In 1989, the Institute received its Royal Charter. Consequently, it became known as the Chartered Institute of Marketing or CIM (CIMb). This also enabled the conferral of Chartered Marketer on the members that met the requirements.

In 1992, the European Union adopted CIM's Diploma as the preferred professional marketing qualification through member states. Shortly afterward, the Diploma qualification is awarded postgraduate status.

Subsequently, CIM established close links with various marketing organization, including Japan, Canada, Australia, New Zealand, and South Africa. It also set up branches through various parts of the world, including Sri Lanka, Hong Kong, Singapore, and Malaysia.

In 2001, the Marketing and Sales Standards Setting Body (MSSSB) (Fourali, 2009), the national standards body (NSB) for these two professional areas, was established by the Department for Education and Skills (DfES) at CIM to develop world-class benchmarks of best practice for the Marketing and Sales occupational areas, as well as associated areas such as Social Marketing and Telesales. The leadership of this body was assigned to Dr. Chahid Fourali, who led it for 8 years. MSSSB worked with dozens of

stakeholders to eventually produce and launch the New National Standards for Marketing and Sales in 2006. Perhaps another significant set of standards that were set up by MSSSB is the Social Marketing (SM) occupational standards that garnered the support of many marketing gurus throughout the world. The SM standards were presented at the very first international social marketing conference in Brighton to an audience of about a thousand participants. It is worth noting that although the MSSSB derived the national competence standards that professional and examining bodies need to demonstrate in their qualifications, some professional bodies may develop their own professional standards that address the professional needs of their constituents. Nevertheless, such professional standards have to be compatible with the national competence standards in order to attract accreditation of their qualifications.

This history shows that the institute has managed to adapt to changes and be a very important influence for change. Such an approach is still being followed to ensure its relevance. For example, in 2014, CIM rebranded and delivered a new strategy which is seen to be more relevant to address current challenges. The approach seems to be bearing fruit, as recently CIM achieved seventh place out of 300 major brands that participated in the Customer Experience dimension run by GfK. The award seems credible as it includes an objective mystery shopping dimension.

Mission/Objectives/Focus Areas

CIM's mission is "To be the pre-eminent body on marketing practice, standards and associated knowledge on an international basis and for this to be acknowledged by governments, marketers, business, education and others."

Structure of Governance

CIM is governed by the Constitution and Board of Trustees that are established by it. The

constitution is made up of the Royal Charter, bye-laws and regulations. The Board of Trustees advises on and approves the strategic direction of the CIM. In turn, the Board is accountable to the CIM members regarding its running and whether its objectives are being met.

CIM is regulated by a group of advisors to the Queen, known as the Privy Council. Its regulations stipulate that any amendments to its Charter have to be supported by the Queen in Council, and any changes to the bye-laws must be approved by the Privy Council.

It is worth noting that Charters are very rarely granted and, so far, less than 1,000 Royal Charters have been granted since 1231. Such grants usually apply to bodies working in the public interest, such as professional institutions, as is the case with CIM.

Five committees advise and support the work of the trustees. These are the Constitution and Ethics Committee, the Disciplinary Committee, the Audit and Risk Committee, the Appointments and Remuneration Committee, and, lastly, the Strategy and Finance Committee.

It's worth mentioning here that CIM had a short experiment with the charity status (between 2001 and 2004), which brought negative media attention regarding the effectiveness of the International Board of Trustees (IBT).

Activities/Major Accomplishments/Contributions

Despite some challenges that CIM faced since its establishment, it is still seen as the paramount body for marketing professionals around the world. This is shown by the high esteem it has by many well-placed personalities, including prime ministers, who have consistently reiterated the importance of marketing to the success of business industries. In terms of its achievements, CIM had helped organize a united perspective to standards setting in marketing-related professional areas represented by a multitude of bodies such as the Market Research Society, the

Institute of Professional Advertising, the direct Marketing Association, the Chartered Institute of Public Relations, the Institute of Sales and Marketing Management, the Institute of Purchasing and Supply, etc. This is no small feat, given the variety of perspectives assumed by the various bodies.

The CIM has now established grades of membership covering Affiliate (ACIM), Member (MCIM), or, at the highest level, Fellow of CIM (FCIM). The benefits include: Association with a professional body with an international reputation; Access to specialist resources; Access to an international network of professionals; and Career advice.

CIM also has a suit of qualifications with an international reputation that range from the most basic level for those starting in their marketing journey (e.g., Foundation Certificate in Marketing) to the Chartered Postgraduate Diploma in Marketing.

CIM Commitment to Advancing Social Issues

Given that the focus of this Encyclopedia is on sustainable management, CIM has a special interest group (SIG) on Charity and Social Marketing issues for members with an interest in the following:

- Non-profits and social enterprises
- Corporate social responsibility
- Behavioral insight and change
- Social marketing

This is in addition to the earlier initiative that CIM supported in setting the first world-class standards for social marketing, in conjunction with the MSSSB (see above) and the National Social Marketing Centre (NSMC). Additionally, a CIM representative (Dawn Southgate, personal communication, 2019) stated that, “in our operations too we aim to cut down on using material that is not recyclable.”

Definition

In no order of human activities, there exists a true absolute certainty that entails the adoption of a certain measure to avoid a hypothetical and unforeseeable future event. As the famous Scottish-American naturalist J. Muir once stated, “there is nothing certain but the uncertain.” To a certain extent, this proverb can be rebutted if it is contrasted with the prospect of minimum

rationality in the decision-making process which affects the global community. In effect, the Chernobyl disaster could have been perfectly avoided if the potential risks of any nuclear reactor had been taken into account and if the decisions had been made following a series of truly effective protocols. In addition this dramatic event which would mark the recent contemporary history, on the one hand, it was partially overshadowed to worldwide public opinion, and on the other hand, it was the result of the “apparatchik,” a functionary class of the extinct Soviet Union whose only aim was to put the political interests before the common welfare. There are, verbatim, thousands of studies that in one way or another have dealt with the Chernobyl tragedy since the dawn of April 26, 1986. This entry of the encyclopedia highlights those sociological-political aspects that contributed to the outcome of the accident so that future generations can be aware of what this disaster meant to ensure that it will never be repeated, on the basis of the prevalence of the democratic values as outlined in the UN 2030 Agenda.

Introduction

The use of atomic energy for civil purposes is one of the fundamental bases of sustainable development (IAEA 2017). At first sight, this statement may seem contradictory or inappropriate given the negative social image of nuclear energy utilization due to painful historical events such as the Hiroshima and Nagasaki atomic bombs or the nuclear accidents associated with climate change such as the Fukushima catastrophe (Skea et al. 2013); nevertheless, the employment of this type of energy is part of one of the 17 global Sustainable Development Goals (Goal 7, Affordable and Clean Energy). The only condition, so to speak, would be that its implementation is carried out in a balanced manner, seeking to minimize its effects on both the environment and people. In fact, the use of nuclear energy according to IAEA (2017) can be positive for several aspects: on a global scale, it accounts for almost a third part of the energy obtained through coal, and it can supply

electricity to growing urban populations or contribute to the economic development of the nations.

On the other hand, it causes a minimal impact on ecosystems. Its consumption of water is comparable to that of other energy sources, except its material requirements (land and economic resources), which are also lower than those of other sources. Therefore, if atomic power contributes to achieving one of the objectives pursued by the UN (“Ensure access to affordable, reliable, sustainable and modern energy for all”), why is there such fear among society regarding its use, either civil or military? Precisely because of events such as Chernobyl, in which a series of errors in the decision-making process were intermingled one after the other, mixing completely rational decisions with others whose illogicality can only be understood in the context of the former Soviet Union (Potter 1990). At that time, the rational-irrational aspect of decision-making was marked by the degree of paroxysm of all the members of society to the interests of the single party, regardless of the consequences they might entail, which is what the Chernobyl catastrophe basically involved.

Two key events in the history of mankind converge in the Pripjat River valley: It was one of the first settlements of the Proto-Slavic tribes in Eastern Europe, but it is above all known for the nuclear disaster that occurred at the site in 1986. When the Soviet authorities decided to construct the future Vladimir Ilyich Ulyanov Lenin Nuclear Power Plant on this location, it was based on its position as a strategic enclave: a few kilometers from the confluence with the Dnieper River, relatively close to Kyiv, the capital of the Ukrainian SSR at that time, and also very close to the border with today’s Belarus (former Byelorussian SSR). The new nuclear power plant was built not far from a centuries-old settlement of medieval origin, Chernobyl, whose name etymologically comes from the archaic Proto-Slavic name referring to the mugwort flower (Melnichuk 1982). As a base for the conglomerate of workers who would render their services in the nuclear power plant, in 1970, a new city was founded practically equidistant from Chernobyl called “Pripjat,” a model city

in which the *Nomenklatura* intended to stage the achievements reached by the triumph of scientific socialism.

The coat of arms of the new city would paradoxically represent an atom, following the Soviet nuclear policy (atomic cities or “atomgrads”) whose motto was popularized as the “peaceful atom.” This is actually the “real” Chernobyl, the tragedy’s ground zero, today a terrifying ghost town surrounded by an exclusion zone that reaches a radius close to 30 km. However, when the disaster became known worldwide, after being deliberately concealed in its early stages, it was named in the same way as the not-too-distant original Chernobyl, which continues harboring a meager population. For obvious reasons, it was preferred to nominalize the disaster in this way rather than remember the official name of the Nuclear Power Plant, in the belief that it would weigh negatively on the figure of the most important leader of the Russian Revolution. This community eventually reached a population of almost 50,000 inhabitants, constituting a center full of life in which scientists from the 4 corners of the former Soviet Union came because it was a city expressly built for them and their families and where they would have a series of facilities and means that were not precisely abundant in any other Soviet population of that time. Nevertheless, in a matter of a few seconds, it passed from being the first place in which any Soviet scientist would have loved to live to the last place that any human being would ever have wished to know.

The Perversion Attached to the Single Thought

The fact that the catastrophe was initially overshadowed or the subsequent observance of continuous failures in the chain of command that should have prevented as well as the continuous disrespect and harassment showed by A. Dyatlov, deputy chief engineer of Chernobyl who was the supervisor of the Reactor 4 of the nuclear reactor to the other members of the scientific staff, it is particularly striking and extremely difficult to understand according to today’s awareness in the field of

nuclear energy. To understand the keys behind the tragedy, it is necessary to recall the behavioral patterns of the Soviet society, in essence very similar to the dystopia presented by Orwell in *Animal Farm*, with which it has many similarities. The omnipresent-omnipotent power of the single party was supported by the *Nomenklatura*, an elitist class which was in charge of the highest functions of the State Administration, receiving orders directly from the Politburo. Below this echelon, there were the *Apparatchiki*, a medium class of functionaries compulsorily belonging to the Party which performed purely bureaucratic functions and which in most cases had a rather limited education. Notwithstanding, it was quite common that they were frequently placed in positions of relative importance that they did not have sufficient preparation for or, even more, that they were reassigned in more than one area during their career. This branch was the executing hand of the Party in all USSR republics, being the most visible part of the very extensive governmental organigram of the State. From this singular way of understanding the meritocracy, the unbreakable adhesion to the single leader and the Party was prevailing, in front of any personal, labor, or academic merit. At a political level, this superstructure facilitated the perpetuation of the system, but at a scientific scale, as it was demonstrated in Chernobyl on 04/26/1986, it was disastrous given that the inflexibility of the predetermined hierarchical hierarchy only obliged to obey orders, not to analyze them and even less to question them, or to allow the slightest communication gap between the supervisor and the subordinates. The construction of a utopian society simply required the total adhesion to a totalitarian regime that knew how to create its own pantheon of heroes attached to the cause. Such is the case of the mythical Pavlik ("Paulie") Morozov, Soviet child-martyr who reported his parents to the GPU, the regime's political police, for having (supposedly) aided the enemies of the state. Consequently, the slightest political dissent was automatically punishable by deportation, loss of civil rights, or, if necessary, the capital punishment. Such a state of collective hysteria contributed to the fact that any citizen could turn in a very short time from hero to villain (never the other the other way around), a fact fully ascertainable in the summary

trial of those directly responsible for the Chernobyl nuclear power plant held in July 1987 (Plokhly 2018). The Soviet criminal trial determined the guilt of five scientists (A. S. Dyatlov, N. M. Fomin, B. V. Rogozhin, A. P. Kovalenko, and Y. A. Laushkin) who were sentenced to several years of imprisonment in labor camps. No one at all could escape the arbitrariness of the regime when applying its harshness, not even the most powerful members of the society. Such was the case of P. S. Zhemchuzhina, wife of the all-powerful V. M. Molotov, the figurehead who seemed destined to replace Stalin, for many years the foreign minister of the USSR and one of the main architects of the redrawing of Europe's borders after World War II. The charges against Zhemchuzhina were based on crimes of high treason, considering her a conspirator in disguise against the regime, basing this assumption solely and exclusively on her Jewish origins. Consequently, in 1948, she was forced to divorce her husband and was sentenced to 5 years of exile in Uritsky, an inhospitable collective farm near Kazakhstan not too far from the ill-fated confinement camp ALZHIR ("Akmola camp for wives of traitors to the Motherland") (Rosinka173 2021). It is fair to recognize the progress of Soviet science in many fields, but it is even more important to underline how this advance would have been even greater if there had not been a continuous purge of dissident or suspected dissident scientists (Solzhenitsyn 1974). Or how these auto-depuration tools were often based on spurious and racist motives, following identical motivations as with P. S. Zhemchuzhina: indeed, the regime from time to time persecuted preeminent scientists of Jewish origin, trying to discriminate or exclude them from the Soviet scientific community (Burg 1979; Schulman and Hsieh 2021). Proof that "Big Brother" controlled or monitored absolutely everything is the gloomy House of Embarkment (Slezkine 2017) a veritable tower of horrors built in the 1930s for the elites of the party. This building consisted of a block of luxury apartments in which the leading members of the party, as well as the most prominent members of Soviet civil society lived together. In reality, its function was not at all to accommodate its tenants but to keep them under

control in the same place, being known by the Muscovites as “The House of Preliminary Detention” or the “beehive”: during the Great Purge, it was a point of no return to a remote labor camp or to the capital punishment. In this social context, it is presupposed that the freedom of any citizen is curtailed, as well as the ability to take a number of rapid or effective decisions which, in the long run, could be considered contrary to the party for questioning Soviet scientific advances. This simple fact is what lies in the background of the Chernobyl catastrophe, for no one dared to contravene a number of orders that were devoid of logic or, even less, to publicly acknowledge the innumerable flaws in the design of the RBMK-1000 reactor, as would finally be recognized by A. S. Dyatlov, deputy chief of staff at the Chernobyl reactor a few years before he died of a heart attack, one of the last effects of the 3.9 sieverts received that fateful night in April 1986 (Dyatlov 1995). At first, this scientist was taken as a scapegoat by the Soviet authorities because of his negligence and ineptitude. Besides, his tyranny and bad manners towards the younger members of the staff he headed became known. However, according to The Moral Code of the Builder of Communism, such an attitude should be justifiable since the end justified the means (MCBC 1961). In fact, as absurd as it may seem, in the development of the Soviet mentality, personal humiliation as a “procedure” played an important role (Mikheyev 1987): “Humiliation is used to bring the prospective members of an institution into line with its values. The would-be initiate has to be brought to recognize, first of all, that his set of values is not the most important and the highest. He must learn that, not only are there other sets of values, but also some (most notably those of the institution) are superior. The individual’s self-esteem should be lowered, and humiliation is the most efficient method of doing this. Humiliation can be physical, psychological, or intellectual, as well as a combination of the three.” Another important factor to take into account is the root of the Soviet nuclear culture, noting in whose hands its design and strategy was originally handed over in 1945: L. P. Beria, who was not exactly characterized as being an apostle of peace or an individual of a conciliatory nature given that he commanded the

fearsome National Security Police during the Stalinist purges (NKVD), also considered the ultimately responsible for the Katyn Forest massacre in which 22,000 Polish prisoners were massacred. This staunch defender of the first Soviet atomic bomb (RDS-1 1949) established a policy of total secrecy about the Soviet nuclear program, generating a certain number of doubts in the world public opinion which are still present today when it comes to distinguishing between when the atomic energy is really being used for primarily civilian purposes (an alibi used by that regime) and when it is being employed for military purposes. The result of such opacity was the concealment of the disaster that occurred in 1957 in Mayak, today’s Russian Federation, which would be on the podium of nuclear catastrophes together with Chernobyl and Fukushima (2011). In this new “achievement,” a failure in the cooling system of one of the plant’s tanks caused its explosion and the consequent generation of a radioactive cloud formed by cesium-137 and strontium-90 which covered an area of more than 300 km and affected at least 22 populations, causing the evacuation of 10,000 individuals who were not notified of the incident until a week later. Such was the degree of secrecy that the plant (Chelyabinsk-40) did not even appear on maps, hence it was called Kyshtym, like the nearest town. In Western countries, the catastrophe was known 20 years later by the dissident physicist Z. Medvedev (Roberts and Medvedev 1977), and this was also apparently the posture of the Soviet authorities concerning Chernobyl (Dyatlov 1995) until the Forsmark nuclear power station in Sweden raised the alarm of the event just 2 days later: inexplicably Swedish scientists had found a particularly high concentration of atomic particles in the plant’s grass, determining that they were of specifically of Soviet provenance (EP 2014). Faced with the overwhelming evidence of the facts and above all, due to their extreme severity, Soviet authorities ended up confirming the tragedy, probably motivated by the fact that such was the magnitude of the drama caused, that they could not solve it by themselves without the help of the rest of the nations. As a result of this fact, the regime had to open up, forcing M. S. Gorbachev to begin the *Glasnost*, a process that in the long run would be essential in the

liquidation of the USSR. In any case, while the politicians came to an agreement and began to clarify responsibilities, the toxic cloud of Chernobyl was spreading throughout Europe, reaching green enclaves such as the Grand Bois de Vielsalm in Belgium (Ronneau et al. 1987), which would also suffer from the Chernobyl disaster.

Origins, Global Expansion, and Significance of the Catastrophe

Unfortunately, the causes and, above all, the consequences of the Chernobyl disaster will never be known in full extent (Yaroshinskaia 2006), and therefore, this entry has to be guided by the official version of the events, made public about a decade after the tragedy by the UNSCEAR report (1998). On April 26, 1986, at 01 h 23 min 04 s, the accident at the fourth Chernobyl reactor was unleashed (Dyatlov 1995), giving rise to a cloud of volatile radioactive materials, including radio-nuclides of iodine, cesium, tellurium, barium, plutonium, or cerium, among others. Everything started when a simple security control test was being carried out, which normally should have been carried out before the whole power plant had come into operation. It involved a short shutdown of the turbine of the number four reactor to check whether its driving force would be sufficient in the hypothetical event of a future emergency shutdown. It seems that the staff in charge of A. S. Dyatlov did not know exactly what the previous shift had done and that this engineer was not known for following the protocols or for creating the best working atmosphere among his subordinates. During the test, the “safety rods” were deliberately and negligently removed from the reactor core, which proved to be defective, causing a sudden and unexpected drop in power, which was quickly followed by a huge increase.

In this situation, and contrary to the opinion of A. S. Dyatlov, the safety button (AZ-5 or “Rapid Emergency Defense”) was pressed, a fact that precisely led to the disaster due to the aforementioned design flaws in the safety of the RBMK-1000 reactor, in which positive radioactivity coefficients were reached when the reactor

reached low power levels. Although the exact number of explosions remains unknown, it appears that there were two, releasing such an amount of energy that the 1000 t outer cover of the reactor was blown off. These explosions led to contact with atmospheric oxygen, which burned the graphite terminals. It was followed by several fires in which the temperature exceeded 2000 °C, dispersing an enormous amount of radioactive materials in the form of dust particles and gases into the atmosphere. In the early hours of the morning, the civil protection services, police, and firemen were called in as a matter of urgency, many of whom perished shortly afterwards as a result of the radiation. In the same way, the employees assigned to the operation of the reactors as well as the workers of other departments and services of the nuclear plant were also mobilized massively (Plokhly 2018).

There was an additional element that turned Chernobyl into the “perfect storm,” the meteorological factor. During the week that followed the catastrophe, the weather conditions were very changeable, hence the shifting winds at different heights contributed to the toxic cloud dispersing within a week all over Europe and, soon after, throughout the Northern Hemisphere of the planet. Figure 1 shows the daily evolution of the cloud during this period and, subsequently, Fig. 2 details the radiation levels reached by various nations 1 year after the tragedy. Obviously, the impact was felt with greater severity in the countries closest to the Chernobyl plant. Note that only the former Byelorussian Soviet Socialist Republic reached between 1 and 2 micro Sieverts. There was nothing to hide, and the Soviet authorities had to take action in the matter, essentially for two reasons: they alone were unable to repair the disastrous situation and, inevitably, they had to clean up the regime’s face to the exterior. Reminiscent of the early stages of the tragedy, the “Oudovenko Report,” a declaration of intentions to the United Nations, which presented a somewhat partial view of the disaster and outlined the present and future measures to be taken in this respect, stands out from this period. In a first step, it was decided to recognize that it was not only a “radiation disaster” but also a “tragedy in the

Chernobyl Disaster, The, Fig. 1 Daily diffusion of radionuclides throughout Europe from the beginning of the disaster. (Source: Own elaboration from UNSCEAR (1998))

Chernobyl Disaster, The, Fig. 2 Equivalent effective doses worldwide, 1 year after the expansion in the atmosphere of the radioactive cloud generated at Chernobyl. (Source: Own elaboration from UNSCEAR (1998))

history of national culture,” appealing to the international cooperation and to an ecological spirit never seen before in the Soviet mentality.

It also tried to give definitive figures on the number of hectares of agricultural and forest land that would never be productive again (144,000 and 492,000, respectively), as well as the number of evacuations (116,000 people), giving a derisory number of direct deaths due to the radioactivity of the plant (30 people). In short, this report attempted to play down the disaster and still praised the regime that had directly created it. Regrettably, this dossier offers an unrealistic and rather short-sighted view of the disaster. Read, for example, Oudovenko (1990): “On 26 October 1989, the Supreme Soviet of the Byelorussian SSR approved a State programme for dealing with the after-effects in the Byelorussian SSR of the accident at the Chernobyl nuclear power plant for the years 1990–1995. In the Ukrainian SSR, a similar long-term programme has been adopted

for the period up to the year 2000. A corresponding programme for 1990–1995 has been adopted in the RSFSR.”

Reality took care of designing a completely different picture, far from the factuality of a simple 5-year plan. Effectively, the problems resulting from the Chernobyl disaster were far from being solved in such a short period of time. The enormous flow of economic resources needed to partially alleviate the drama would gradually arrive from the West (EC 2015), from nations not involved in the genesis of the tragedy which opted for the benefit of the community to restore the ominous repercussions of this disastrous episode. Figure 3 shows the evolution of the bibliographic production related to Chernobyl by including all those papers indexed in the Scopus database between 1900 and 2020 that contain the term “Chernobyl” in their title. It should be noted that until April 26, 1986, “Chernobyl” was a minor topic, present only in very few manuscripts published in Soviet scientific journals (Skachenko

Chernobyl Disaster, The, Fig. 3 Evolution of the scientific production focused on the research of the Chernobyl catastrophe (1900–2020). (Source: Own elaboration)

Chernobyl Disaster, The, Fig. 4 Scientific contributions that have analyzed the Chernobyl disaster by knowledge fields (1900–2020). (Source: Own elaboration)

and Budas’ 1976; Shul’tsev et al. 1982; Golubev et al. 1982; Novosel’skii et al. 1984).

In this respect, Fig. 4 complements the previous illustration by detailing the different scientific areas that have studied this disaster. In fact, it can be observed that practically no area of human knowledge has been exempted from the scope of Chernobyl.

The following disciplines are included under the category Other: Chemical Engineering, Psychology, Immunology and Microbiology, Materials Science, Neuroscience, Business, Management and Accounting, Economics, Econometrics and Finance, Computer Science, Nursing, Mathematics, Veterinary, Decision Sciences, Dentistry, and Undefined.

Summary

Although a planned economy is at a clear disadvantage in several respects compared to a free market economy, it also has a great advantage: in the absence of any control by the citizens, the governmental authority can dispose of an

enormous amount of resources of all kinds in a given area of research, in this case, in the field of nuclear energy. On the other hand, under no circumstances could it be said that Soviet scientists were not of a high level, just the opposite. Precisely, from the same academic institution where the reviled A. S. Dyatlov completed his studies, the Moscow Mechanical Institute, emerged famous world-class researchers, among them Nobel Prize winners such as N. G. Basov, P. Cherenkov, I. M. Frank, A. D. Sakharov, N. N. Semyonov, or I. Tamm. Thus, if all types of resources were available and the scientific background was optimal, what was the real problem of Chernobyl?: it was precisely its lack of monitoring and a complete subordination to the power of the ruling party, where the only option was to execute orders, to broadcast the merits of the revolution and to silence all its shortcomings. In the case of Chernobyl, it was decided to proceed according to the easiest way: to blame a group of chosen ones instead of elucidating responsibilities starting from the highest positions of the administration. Evidently, this exercise was an entelechy in the former Soviet Union since the

Chernobyl Disaster, The, Fig. 5 Main factors that caused the tragedy of Chernobyl. (Source: Own elaboration)

party elite was practically irresponsible before the law and its decisions were peremptorily accepted by unanimity. Moreover, the new society that had arisen under the revolution developed its own axiological system, openly opposed to the Western one, whereby due obedience was the main value of a citizen, regardless of any context or circumstance. As shown in Fig. 5, such a system impeded the option of denouncing the well-known reactor failures, the free interaction between the members of the scientific teams, or the establishment of an effective nuclear safety policy.

In other words, fear was used to restrain and drive the civilian population, not to take coherent solutions or emergency decisions as it happens nowadays in practically all democratic countries that try to preempt to events by developing proper macro-level emergency policies and instructing on leadership and coordination in the sphere of the Public Administration (Farazmand 2016). Hence the importance of inculcating the values of democratic coexistence in citizens by following in the wake of the UN 2030 agenda. Besides many other factors, it is necessary for citizens to evaluate for themselves the convenience of nuclear energy, as well as to be able to prevent its risks. It is simply a matter of replacing fear and terror with respect and awareness, factors that were, unfortunately, lacking at Chernobyl on the fateful night of April 26, 1986. It seems that Sir W. Churchill once stated: “Democracy means

that when there’s a knock in the door at 3 am, it’s probably the milkman.” Following this same parallelism, it is assumed that there must be a certain democratic shortfall if at the same hour a brigade knocks on the door of any citizen and invites them to leave their residence because of a potentially avoidable atomic accident.

In recent times, the Chernobyl catastrophe has been felt among the new generations, those who had not yet been born when the disaster occurred, who, educated in other principles so different from the context in which the tragedy originated, such as tolerance or democracy, are surprised to contemplate to what extreme the unreason of the human being subject to totalitarian opprobrium can lead. Series such as “Chernobyl” (Renck 2019) have contributed to the young people’s first-hand knowledge of what happened that fateful night, but other sources such as Shramovych and Chornous (2019) suggest that there is more fiction than reality in the plot of the outcome, an aspect that may not be so relevant given that perhaps it will never be known clearly how the incident occurred, given that at the beginning everything possible was done to try to hide it.

Chief Executive Officer (CEO Duality)

Rebeca García-Ramos and Belén Díaz Díaz
Department of Business Administration,
University of Cantabria, Santander, Cantabria,
Spain

Synonyms

CEO duality; Dual leadership structure; Duality of power; Pure duality

Definition

Chief executive officer (CEO) duality refers to the relationship between the chairperson of the board of directors and the CEO of the company. More specifically, duality of power is defined as the union of the positions of board of directors chairperson and the CEO of the firm in the same person (Gove et al. 2017). This definition of CEO duality, accepted by a greater number of academics, is the so-called pure duality or dual leadership structure (Krause et al. 2014).

Key Issues

The separation of the roles of CEO and board chairperson is an issue that has generated great debate in the literature on corporate governance and one that is still unresolved (Chang et al. 2019; Daily and Dalton 2015; Wang et al. 2019). Although there is no unanimity in the recommendations of codes of good governance, in general they suggest an effective separation of the figures of CEO and board chairperson, and none of them

explicitly advocates for CEO duality (Andrés and Santamaría 2018). In this sense, CEO duality is often perceived as a symbol of poor governance (Adams 2017).

Academic literature offers conflicting views on the advantages and disadvantages associated with CEO duality (Krause et al. 2014). “CEO duality is more common in some countries than others and it is important to understand the institutional features that drive this variation before jumping to conclusions concerning the benefits, or lack thereof, of duality” (Adams 2017, p. 55). There are important differences by countries (e.g., cultural, institutional, legal causes) that lead to some countries where it is difficult to find firms with CEO duality (e.g., Finland, Norway, Denmark) and other countries in which CEO duality is very common (e.g., France, Spain, Germany, the USA) (Andrés and Santamaría 2018).

From an agency theory perspective, CEO duality has been criticized and catalogued as an inappropriate way to design the leadership structure of the firm (Jensen 1993). From this approach, leadership structures that have an effective separation of the figures of chairperson and CEO make boards more efficient (Aktas et al. 2019). The leadership structure provides information on the power of the board in relation to the executive management of the company and, therefore, is an indicator of the degree of independence of the board with respect to the management team in general and from the CEO in particular. In this sense, it is argued that the separation of powers allows boards of directors to efficiently develop their supervisory role given that boards without CEO duality are considered more independent (Fama and Jensen 1983). Moreover, an independent chairperson could have important contacts (e.g., with banks and governments), which could provide valuable networks for the company (Yusoff 2010).

The board of directors must ensure that the CEO and the rest of the directors act in the interest of the owners. As discussed above, the leadership structure is related to the independence of the board, so that those dual structures can compromise that independence to properly supervise the performance of the CEO (Daily and Dalton 2015).

If the figures of the board chairperson and the company CEO fall on the same person, a concentration of power will arise allowing said person to engage in opportunistic behavior and make decisions in their own interest, at the expense of the interests of the shareholders. This can lead to inefficient supervision of managerial opportunism by the board (Martin and Butler 2017).

On the other hand, proponents of the stewardship theory advocate for CEO duality (Donaldson and Davis 1991). Under this approach, the CEO is a good steward of the company they manage and does not engage in any opportunistic behavior (Krause et al. 2014; Martin and Butler 2017). In this sense, non-CEO duality is perceived as a supervisory mechanism, which will reduce the pro-organizational attitude of the top executive, with the consequent inconveniences that this would imply for business activity. However, when the positions of the CEO and the board chairperson are held by the same person, the more authoritative decision-making leads to a better corporate performance (Braun and Sharma 2007). This argument is based on the idea that the executive management of the company has close ties with its day-to-day business activity and, therefore, has more detailed and accurate information (Martin and Butler 2017). From this point of view, García-Ramos and García-Olalla (2014) pointed out that CEO duality is more likely to lead to situations in which the benefits derived from the greater flow of information, as well as the greater unity in decision-making, overcome the inconveniences resulting from agency problems (Adams and Ferreira 2007; Donaldson and Davis 1991).

Arguments based on the stewardship theory link directly with the advisory role of the board of directors. To this end, it can be expected that the presence of the CEO on the board will have a positive effect on business results, because the CEO has specific knowledge about the firm, its strategic direction and its investment opportunities, which can help to take optimal decisions (Brickley et al. 1997). As stated by Adams and Ferreira (2007), if the CEO is at the same time chairperson of the board, they will make his

information available to the directors, allowing them to carry out their work of advising the management team more efficiently. Advocates of dual leadership structures argue that CEO duality provides a clearer vision of corporate objectives and lets stakeholders know that the direction of the management does not present ambiguities (Finkelstein and D'Aveni 1994). Moreover, CEO duality reduces the steps of the communication process and the costs of transferring relevant information between the CEO and the chair of the board. It is also argued that CEO duality increases supervision to identify the possible effects of entrenchment and that CEO duality is more effective because the same individual can exercise full control over the company and provide a clear criterion that allows corporate objectives to be achieved (Yusoff 2010; Martin and Butler 2017).

Future Direction

The contrasting views of theoretical perspectives regarding the leadership structure derive from the different approach taken to explain the relationship between the management of the company and its shareholders (Krause et al. 2014; Martin and Butler 2017). It is common in previous research to adopt one view over the other and to assume that there is a universal leadership structure that fits all organizations. However, this assumption is not realistic. The optimal leadership structure is more likely to depend on other contextual variables, such as the size of the company, its age, the activity sector, the country in which it operates, the legal and institutional environment, or the ownership structure, both in its quantitative (concentration) and qualitative (identity of the control shareholders') dimension, as well as on the role and power of the different agents participating in the firm (Aguilera and Jackson 2003; Aguilera 2006; Huse 2005).

From an empirical point of view, there are several studies that have analyzed the relationship between the leadership structure and corporate performance. However, the results are

inconclusive, and nowadays there is no consensus about whether dual or non-dual leadership structures should prevail in companies in different world economies (Krause et al. 2014). “Whether or not the individual holding the Chair position uses it to accumulate excessive power is likely to be a function of [...] the characteristics of the individual holding the position” (Adams 2017, p. 55). Moreover, recent studies conclude that “CEO duality may be a strategic leadership structure under certain circumstances and will not universally result in excessive CEO power and unchecked discretion” (Wang et al. 2019, p. 191). Policymakers, practitioners, and academics should consider all these concerns when deciding the optimal board configuration in order to advance our knowledge of corporate governance.

³UniSA Business School, University of South Australia, Adelaide, SA, Australia

Definition

A circular economy is a production system designed to minimize the use of resources in production and to reduce unwanted negative externalities from manufacturing processes including waste, emissions, and energy leakages. Such an approach is differentiated from linear production approaches that are built on the premise of “take-make-consume and dispose” (Camilleri, 2019; EU, 2014) that presume that resources are abundant, available, and easily disposed of.

A circular economy can be achieved by remanufacturing, refurbishing, reusing, and

recycling resources and repairing goods and resources that were consumed in production or use, so safeguarding the natural environment. It is essentially a long-lasting closed loop product service system (EMF, 2013). It is a system that balances economic development with environmental and resource protection. It leads to higher operational efficiencies through both responsible production and consumption behaviors (UNEP, 2006).

Introduction

Prior to the industrial revolution, business and industry seldom disposed of waste and by-products. In many cases, waste was reutilized and recycled as it was too costly to obtain new resources. Over the years, however, particularly in the last century, manufacturers changed manufacturing methods and resorted to large-scale production of disposable goods.

Growing populations and increased wealth lead to greater demands for products that have to be disposed of once they have been used. While some of these used items will find their way into landfills, others pollute and linger in the environment more broadly where they pose risks to flora and fauna. Waste products of both production and consumption are sometimes dealt with through incineration which may increase concentrations of residual toxins including heavy metals which may in turn contaminate air, groundwater, and oceans, contaminating the ecosystem. For example, plastic waste dumped into the oceans has formed a large plastic island in the Pacific Ocean. A specific area known as “Great Pacific Garbage Patch” is responsible for the deaths of millions of tonnes of fish, seabirds, and sea mammals (NOAA, 2022). These are some of the detrimental effects resulting from industrial activities. This production and consumption pattern contributes to greenhouse gas emissions, the warming of the earth’s climate, and ongoing land degradation including the disappearance of arable land and desertification.

In the light of these impacts on the natural environment, a circular economy could contribute to restoring the planet. The idea of a circular economy is essentially based on three principles: the

elimination of waste and pollution, the circulation of products and materials (at their highest value), and the regeneration of nature (Ellen MacArthur Foundation, 2013). Hence, it requires a transition to both the recycling of materials and to renewable energy.

A circular economy system aims to decouple economic activity from the consumption of the planet's finite resources and requires using resources more efficiently. It requires eco-friendly designs of production and products, waste prevention and reutilization and recycling of materials. Such improved production and product designs and use of materials are predicted to result in better environmental outcomes as well as improved businesses' financial performance (Camilleri, 2020; Stahel, 2016; Van der Linde, 1995).

Key Policies and Regulatory Interventions

Over the last few decades, a number of intergovernmental institutions including the United Nations Environment Program (UNEP) and the European Union (EU), as well as a number of nongovernmental organizations and other advocates, have increasingly called for raised awareness of sustainable production and consumption possibilities (Camilleri, 2020; EMF, 2013; Lieder & Rashid, 2016), for example, the 2002 UN Report of the World Summit on Sustainable Development in added reference to unsustainable patterns of production and consumption. In that report, UN member states were urged to manage their natural resources in a sustainable manner, with lower negative environmental impacts. They were urged to promote conservation, biodiversity, and the sustainable use of ecosystems, while reducing waste (WSSD, 2002, p. 13). The resolution A/RES/66/288 – The Future We Want – allowed the UN General Assembly to reaffirm its commitment to green economy policies in the context of sustainable development.

Governments voting in favor of these resolutions commit themselves to promoting and implementing policies supporting sustainable

development and management of ecosystems, including their conservation, regeneration, and restoration (UNCSD, 2012). In 2015, a General Assembly Resolution A/RES/70/1 – Transforming our world: the 2030 Agenda for Sustainable Development – was put to the floor. World leaders adopted this latest iteration of the development policy, the Sustainable Development Goals “(‘SDGs’), which replaced the Millennium Development Goals of 2000. In the context of production and consumption, Sustainable Development Goal 12 “Sustainable Consumption and Production” noted a need to change policies and practices for business in order to increase sustainability through changes as noted, to production and product design, as well as noting the potential economic gains to be had by resource and energy efficiencies. The United Nations SDGs also raised awareness about the potential of sustainable infrastructure. It urged member states to address air, water, and soil pollution to minimise their countries’ impact on the environment (UNDP, 2015). Later, focusing on greenhouse gas, the Paris Climate Agreement (COP 21), Resolutions 1/5 and 2/7 on chemicals and waste, and Resolution 2/8 on sustainable production and consumption, of June 27, 2014, and May 27, 2016, respectively, are important policy instruments that support a circular economy agenda.

These international, intergovernmental commitments to sustainable development, consumption, and production have generated increased pressures on governments to regulate their industries and to improve related environmental practices (Sheehy & Farnetti, 2021). Indeed, in 2014, the European Union (EU) Commission anticipated that, “new business models, eco-designs and industrial symbiosis can move the community toward zero-waste; reduce greenhouse emissions and environmental impacts” (EU, 2015).

Eventually, in March 2017, the EU Commission and the European Economic and Social Committee organized a Circular Economy Stakeholder Conference, where it reported on the delivery and progress of some of its Action Plans. It simultaneously established a Finance Support Platform in collaboration with the European Investment Bank (EIB) and issued important guidance documents

to Member States on the conversion of waste to energy.

There have been several other EU Communications on this subject, including:

- “Innovation for a sustainable future – The Eco-innovation Action Plan”
- “Building the Single Market for Green Products: Facilitating better information on the environmental performance of products and organisations”
- “Green Action Plan for SMEs: enabling SMEs to turn environmental challenges into business opportunities”
- “Closing the loop – An EU action plan for the Circular Economy” and the report on its implementation
- “Investing in a smart, innovative and sustainable Industry – A renewed EU Industrial Policy Strategy” (EU, 2017)

More recently, the European Commission adopted a set of measures focused on the use of plastics. These include the document a “Strategy for Plastics in the Circular Economy” which stipulated that all plastic packaging must be recyclable by 2030. It has further released a communication on the interaction among chemical, product, and waste regulations. In support of these policy initiatives, the European Commission launched a Monitoring Framework to be used to assess the progress of its member states toward the circular economy. This framework is comprised of ten key indicators: (1) EU self-sufficiency for raw materials; (2) green public procurement; 3a–c) waste generation; (4) food waste; (5a, b) overall recycling rates; (6a–f) recycling rates for specific waste streams; (7a, b) contribution of recycled materials to raw materials demand; (8) trade in recyclable raw materials; (9a–c) private investments, jobs, and gross value added; and (10) patents.

Conclusion

Many actors’ international bodies to regional and national governments in addition to

nongovernmental organizations and private actors such as industry associations have formulated policies and codes for sustainable development and responsible production and consumption (Camilleri, 2015, 2020; UNDP 2015; UNCSD 2012). Nevertheless, potential challenges remain for the development and implementation of the circular economy’s closed loop, production, and product systems. The economic implications of the development and implementation of the circular economy pose distinct challenges to industry and to lesser endowed governments. As a result, there are and will continue to be calls for contributions from government and other actors to provide economic support through subsidies, tax breaks, and other incentives to support the circular economy.

Summary

This contribution provides a definition of the circular economy (CE). It features a short introduction on this paradigm and sheds light on regulatory guidelines and principles that are intended to foster CE behaviors.

Circular Economy in the Built Environment

Brian Jones

Leeds Beckett University, Leeds, West Yorkshire, UK

Synonyms: Circularity, CE

Definition/Description

The Circular Economy (CE) provides a conceptual framework that challenges the established linear model of economic growth by prioritizing environmental concerns and putting these at the center of a new approach to sustainable economic growth (Bocken et al., 2019). Minimization of waste, reducing resource and material use, and re-using, and recycling are the entire areas which feature prominently in the CE debate. A useful definition is provided by the EU:

The circular economy is a model of production and consumption, which involves sharing, leasing, reusing, repairing, refurbishing and recycling existing materials and products as long as possible. In this way, the **life cycle of products is extended**. In practice, it implies **reducing waste**

to a minimum. When a product reaches the end of its life, its materials are kept within the economy wherever possible thanks to recycling. These can be productively used again and again, thereby **creating further value**. (European Parliament, 2023)

The Built Environment, as implied by the name, refers to building and associated infrastructure, and while it is about the physical space, it has social and environmental dimensions. Indeed, the physical, social, and environmental dimensions are interconnected, and all have consequences for the health and wellbeing of the people who live there or visit. This marrying up of the physical, social, and environmental provides for an inclusive approach to the built environment that does not prioritize one over the other but sees them as mutually reinforcing.

The CE and Built Environment intersect in the drive to create a more sustainable future.

Introduction

The circular economy is a much-discussed concept at the academic (Antikainen & Valkokari, 2016; Konietzko et al., 2020), policy (European Commission, 2016 and 2021; European Parliament, 2023), and business (Arup, 2016; World Economic Forum, n.d.) levels. There is no one universally agreed definition of the CE, and as such, it is a contested and much discussed concept. Different points of emphasis are given to CE by different countries of varying political persuasions; as well as within and between regions, business sectors, academic positions, policy approaches, and actual “real-world” practice.

As a large consumer of resources from the natural environment, those involved in creating the built environment have much to consider and to do in delivering on the ideals of the CE. The CE plays into the ideal of creating more sustainable, people-friendly, commutable, and liveable cities. Waste reduction is a central tenet of the CE, but this is somewhat problematic for the building industry involved, as it is in demolition and construction which generates waste and uses a

considerable amount of resources and materials (UK Green Building Council, 2023). The built environment plays a significant part progressing the CE debate, in part because of the amount of energy and materials used, and greenhouse gases generated. The built environment shapes thinking in this area and influences the policy-practice business agenda.

Sharing, Leasing, and Using Anew

To achieve waste reduction, the focus should not only be on production but also consumption. Finding new ways to live in the built environment and to create sustainable cities by extending the life of existing products and recent technological innovations offers one way forward. The collaborative, platform, or sharing economy serves as one example of this and can be illustrated through the example of Airbnb or BlaBlaCar. The sharing, leasing, and reusing of products such as apartments, houses, and cars are examples of how the CE and built environment are being re-worked and re-imagined through the use of technology as part of the new platform economy. The debate on the sharing, collaborative, or platform economy makes competing claims for its impact and perceived impact on the local community, natural environment, and resources (Perez-Vega et al., 2021; Miguel et al., 2022).

Energy Inefficient Buildings

The built environment contributes to greenhouse gases, and planning and urban development that is sustainable provides a start for cities that value the principles and ideals of the circular economy. Old buildings are usually energy inefficient, and at the same time, new buildings use energy and materials in their construction. There has been much recent public and policy discussion about the retrofitting of old buildings so that they become more energy efficient. Demolition of old buildings is postponed, and new life is breathed into them as their product life is extended. Repurposing old energy inefficient into energy-efficient buildings is a positive result and is one clear example of the CE principles in action. Sustainable urban development seeks to address the UN SDGs and, as such, is very much about the CE.

Definition

Civil Economy is a school of thought promoted by leading economists and scholars, inspired by the thought of Antonio Genovesi (1713–1769) and leading intellectuals of the Italian Enlightenment period (Dal Degan [2018a](#)). This intellectual tradition is retrieved and actualized as its understanding of the economic discipline and business role within civil society are believed to be best suitable to face contemporary challenge such as raising inequality, climate change, and democratic crises (Bruni and Zamagni [2009](#)). Originally circulated within the Italian academia and afterward developed and disseminated with international scholars, business actors, civil society organizations, cultural foundations, and third sector institutions, Civil Economy represents an alternative approach to political economy. It is based on the revision of the economic anthropological assumption of the *homo oeconomicus* that should be replaced with the Aristotelian *zoon politikon* paradigm (Bruni and Zamagni [2007](#)). This vision entails that the market and its actors are to be understood as being embedded within cultural, religious, intellectual, spiritual, and political relations. This tradition proposes that responsible business, social business, moral economic behavior, cooperation, sustainability practices, care for

the Common Good, and common goods should be analyzed through the tools of a human and relational-based approach rather than neoclassical individualistic models (Carrier 2012; Bruni and Zamagni 2009; Schlag and Melé 2020; Bruyn 2000). Civil Economy collects insights on relationality as a category of the economic discipline from the History of Economic Thought and Business History up to the present days, in order to provide Business Ethics with a coherent underpinning holistic vision of the economic political theory (Screpanti and Zamagni 2005).

Introduction

The Civil Economy school of thought develops an alternative understanding of Political Economic Theory based on tradition and innovation: on one side, it rediscovers neglected or lost traditions within the History of Economic Thought and Business History (or particular readings of mainstream approaches and authors, such as Adam Smith's interpretation; Zamagni 2008; Bruyn 1999), on the other side it seeks to provide to Business Ethics contemporary approaches a theoretical framework based on humanism and relationality, thus being able to explain morally oriented economic behaviors and develop sustainable business models based on insights coming from the role of business within society (Sapelli 2013; Costa and Ramus 2015).

The term Civil Economy is retrieved from the work of Antonio Genovesi, who was an Italian economist as other relevant intellectuals of the time such as Ferdinando Galiani, Gaetano Filangeri, Cesare Beccaria, Pietro Verri, and Giammaria Ortes (belonging to different cities, Porta 2011). Genovesi is considered the founder of the Italian economic thought as well as a leading intellectual of the Italian Enlightenment, which was developed within the intellectual scenario of urban civilization in the XVIII Century (Porta 2018; Screpanti and Zamagni 2005; Stapelbroek 2006). Genovesi taught the oldest academic course in economy, at the University of Naples, titled "Civil and Mechanical Economy" and his 1756 *oeuvre* is known as "Lezioni

di economia civile" ("Lectures on Civil Economy"). Building on this tradition, contemporary Civil Economy recalls its cornerstone idea that "*the pursuit of self-interest is a passion compatible with other people's interests*" (Zamagni 2008, p. 474). In this light, the shaping of the economic discipline as such can be understood as a social science with strong moral and anthropological assumptions: indeed, both Adam Smith and Antonio Genovesi grounded their economic visions in moral philosophy backgrounds (Genovesi 2013). Both of them argued that self-interest is compatible with the pursuit of public interest, but they differ in the understanding of how economic behavior relates to this human leaning toward the others: while, according to Adam Smith, economic and business relations are impersonal and it is desirable for them to be so, for intellectuals belonging to the Civil Economy school of thought those relations are highly personal and involve a great deal of variables that cannot be reduced to the unique tension to self-interest and profit maximization (Dal Degan 2018b; Bruni and Zamagni 2009). Civil Economy underlines how the first treatises of the economic discipline considered an autonomous field of thought were highly concerned with the issue of public happiness (Screpanti and Zamagni 2005) and, accordingly, with the idea that people organize economic institutions (such as the market) to find common ground and common rules to pursue societal well-being, in order to reaffirm that Business Ethics does not address a particular side of economic relations but rather represents the original essence of the discipline. According to the paradigm of Civil Economy, both markets and business organizations serve social purposes and have to be studied as being inherently not individualistic neither political, but rather as ontologically belonging to the civil society terrain where the human being realizes its potential and seeks *eudaimonia* (Bruni and Zamagni 2009). The market economy is thus considered to be not the place where Hobbesian negative anthropology of the striving *homo homini lupus* takes action, but, on the opposite, is conceived as: "human nature trying to civilize itself" (Bruyn 2000, p. 242), i.e., the place where human needs are met in reciprocal dynamics.

By proposing a positive anthropology as underpinning economic and business models, Civil Economy can be considered part of the field of interest of recent studies, such as humanistic management (Schlag and Melé 2020; Melé 2013) with which it shares a common vision on the nature of human beings and a common critical address toward utilitarianism and economicism (Melé 2003). Both the Civil Economy and the Humanistic Management paradigm refuses the idea that the market is unethical and that the economy should be disembedded from society and thus analyzed regardless of historical, cultural, religious, political, and spiritual variables that affect both its structure as a social institution and people's behavior when interacting through it. Moreover, both paradigms aim to overcome the vision of the market as being a neutral mechanism, detached from the above-mentioned variables that can be extended to non-economic spheres of social life (Polanyi 1944). On the contrary, Civil Economy and Humanistic Management develops theoretical frameworks and models apt to grasp why and how the economic sphere includes nonprofit and nonexploitative exchange and production relations, such as gratuity, gift, cooperation (Bruni and Zamagni 2009; Zsolnai 2011). These similarities shed new light on the innovative features of Civil Economy, which represents both an attempt of circulation of so far less popularized theories within the History of Economic Thought, as well as a useful paradigm to enquire into the features and the possibilities of responsible and sustainable business and its ability to balance profitability and moral-driven aspects (Baldarelli and Del Baldo 2013).

Civil Economy represents a coherent theory of social wealth creation and allocation, providing understanding of the mechanisms of its production and distribution as well as explanation of its social purpose and shared meaning for people involved in economic relations (Costa and Ramus 2015).

Key Issues

By providing to Business Ethics a positive anthropological model (*zoon politikon*) and by

reestablishing the original moral philosophical inspiration in which History of Economic Thought was originally rooted (Screpanti and Zamagni 2005; Roncaglia 1996), Civil Economy provides theoretical and conceptual frameworks, as well as empirical research tools, able to explore all those issues that, through the *homo oeconomicus* model, would otherwise be neglected or difficult to subsume to the motive of self-interest: some of them are the notion of Common Good and its spiritual influence, the idea of caring for common goods and the environment, the issue of public happiness and the economic concept of relational value.

In line with the thought of the very founder of the Italian tradition of *Economia Aziendale* Gino Zappa (1879–1960), it is possible to address business organizations as being subject to three *raison d'être* and social functions: they serve the need of exchange and production through market institutions, they fulfill economic sustainability objectives, they act according to “other purposes” (Costa and Ramus 2015). The latter dimension would be impossible to grasp without a thorough understanding of values, beliefs, and spiritual/personal influences informing entrepreneurship and management actions (Del Baldo 2020). According to this view, which conveys a proper ontology of the firm, as the one proposed by Gino Zappa's vision, it would be impossible to make sense of firms' choices and behaviors disregarding the analysis of the relations it is embedded within. In turn, the firm itself can be evaluated as being functional or dysfunctional according to the social aims that society pursues through it (Bruni and Zamagni 2009, p. 60). Among intellectual traditions that are revisited by Civil Economy scholars, insights taken from the Catholic Social Thought hold a significant place in discussing the notion of Common Good and providing an accomplished vision of entrepreneurship and the firm as an economic organization that overcomes its economic goals (Baldarelli 2006). The idea of Common Good, i.e., a transcendental dimension that gives purpose to human life and human actions (Schlag and Melé 2015), informs Civil Economy insofar it provides explanation to the influence of intangible

values and shared purposes on economic life and business governance and organization (Costa and Ramus 2015; Bouckaert and Zsolnai 2012). Concern for the Common Good represents one of the possible reasons why business actors choose to behave responsibly, not only because of reputational reasons but moved by *intrinsic* motives (Del Baldo 2017) as well as moved by a higher ideal that binds humankind together and fosters virtue-based actions with solidarity and reciprocity features. By opposing the Friedman Doctrine (Friedman 1970) Civil Economy provides theoretical and empirical evidence of altruistic business models and leaderships committed to spiritual values (Schlag and Mercado 2016; Del Baldo 2020). Ultimately, the theoretical link between CST and Civil Economy is provided by the common quest for answers to a fundamental research question consubstantial to all Business Ethics studies: “*Does economic life enhance or threaten our life together as a community?*” (Economic Justice for All, issued by the US Catholic bishops in 1986, quoted in Finn 2010, p. vi).

Civil Economy represents also a power paradigm to explain the simultaneous coexistence of heterogeneous forms of economic organization and relation, not entirely or not at all belonging to capitalism nor satisfactorily definable using market rules and profit-driven reasoning (Porta and Scazzieri 1997). Hybrid forms of not-entirely economic nor State-controlled economic phenomena need to be understood against the *zoon politikon* background (Bruni and Zamagni 2009): it is the case, among others, of philanthropic and nonprofit organizations (Nigri et al. 2020), actors and issues connected to the economy of care (Schoenmaker 2020), social business and cooperatives (Kay and McMullan 2017; Menzani and Zamagni 2010), forms of exchange through gift and gratuity (Faldetta and Paternostro 2011), and common goods governance theories (Ostrom 1993). Civil Economy contributes to studies adopting the Integral Ecology perspective (Jakobsen and Zsolnai 2017) by providing anthropological insights on both the relations between humankind and the ecosystem as well as the relations between human beings in

order to ensure environmental and social sustainability (Deak 2017). Civil Economy represents a valid contribution to the discussion of public happiness and social welfare as a sphere of interest that investigates economic prosperity beyond current measures of economic growth (Pabst 2018; Bartolini 2007). It seeks to frame the latter within shared prosperity and sustainable value creation for local communities and workers (Zamagni et al. 1999; Mazzucato 2017; Mirowski 1991a).

Human relations and relational value are the core of the epistemological reflection undergone by scholars of Civil Economy. Reinstatement of anthropology and philosophy, overcoming the neoclassical influence exerted by Physics (Mirowski 1984) and Mathematics (Mirowski 1991b; Röpke 1960; Roncaglia 1996), allows to focus on variables that cannot be quantified objectively, promoting enquiries on motives and interpersonal dynamics resulting in certain economic actions rather than focusing only on the output of those actions (Bruni and Zamagni 2009). Civil Economy addresses “interpersonal relations”: it proposes to add to notions of value of use and value of exchange the one of relational value (Zamagni 2008), thus relationality becomes a category of economic thinking (thus contributing to understand the value of others categories such as interdependence as well (Gatzia 2011).

Civil Economy aims to raise awareness on the performative power of the discipline, i.e., on its systematic affection of the object of investigation. Indeed, not only does Civil Economy focuses on aspects of economic life that are not quantifiable (Bruni and Zamagni 2009), it also aims to influence those aspects by reinforcing the moral side of the economic thinking and of business behavior, highlighting how the two spheres are intertwined (for instance, when discussing economic crisis, Jackson 2010). Civil Economy reinforces already existing theories that consider Business Ethics an endogenous rather than exogenous feature of the economy (Nilakant and Addison 1999), by specifying that there is a close relationship between anthropological economic assumptions that are

provided to economic and business models and good or bad moral-wise behavior. This means that responsibility and ethical concerns are at stake not only for economic actors and business organizations but for scholars in the field and economists as well: ultimately, Civil Economy provides a vision of the economic discipline as being a form of civil engagement itself (Bruni and Pelligra 2002).

Summary

Civil Economy provides the economic discipline with a revision of its original inspiration, enrooted in moral philosophy and ethics. Its main promoters argue that a significant change in anthropological assumptions upon which economic models are built is needed to face contemporary grand challenges, such as raising inequality and climate change. In this light, irresponsible behavior by firms and economic actors is not framed as being the output only of legislative loopholes and uniquely profit-driven business plans, but as a consequence of a certain anthropological understanding of the human nature as being self-interested. On the contrary, Civil Economy reaffirms the constitutive sociable feature of the humankind, according to which business, economic institutions, and organizations (such as the market, the firm, the cooperative organizations, banks and financial institutions, and others) are animated. Civil Economy defines itself as “l’economia come se la persona contasse” (Bruni and Zamagni 2009) [“The Economy as the person would matter”] and according to this inspiration provides an academic paradigm able to understand interpersonal relational value and intangible morally driven goals underpinning economic life.

Clean Development Mechanism (CDM)

Minna Havukainen, Pirjetta Waldén and Helena Kahiluoto
School of Energy Systems, Sustainability Science, Lappeenranta-Lahti University of Technology LUT, Lahti, Finland

Synonyms

[Instrument of market-based climate change mitigation and development](#)

Definition

The Clean Development Mechanism (CDM) is the most significant of the three flexible mechanisms under the 1997 Kyoto Protocol. The mechanism allows countries with greenhouse

gas (GHG) emission reduction targets under the Kyoto Protocol to implement emission-reduction projects in developing countries. In turn, CDM project proponents earn credits called certified emission reductions (CERs). The main purposes of the CDM are to reduce the cost of complying with the Kyoto Protocol for industrialized nations while also promoting sustainable development in countries with economies in transition. Ultimately, the global initiative is meant to provide CDM project proponents with more options to fulfill their emission reduction targets, strengthen sustainable development, and mitigate climate change.

Introduction

Climate change is the biggest threat to humankind. Therefore, decisions and actions are required to limit global warming and set specific targets for GHG emissions. The United Nations Framework Convention on Climate Change (UNFCCC) was established to set global climate strategies based on a principle of “common but differentiated responsibilities.” According to this principle, each country is responsible of limiting the greenhouse gas emissions depending on their resources. The CDM is one of the three flexibility mechanisms under the Kyoto Protocol for achieving the targets of the UNFCCC, along with Joint Implementation and International Emissions Trading. The CDM has the dual aim of achieving emission reductions alongside sustainable development in host countries.

UNFCCC has faced criticism related to CDM process, inadequate additionality, minor sustainable development benefits, and uneven distribution within host countries. CDM projects have been criticized for being short-term, ad hoc, and unable to promote clean and renewable energy in host countries (Watts et al. 2015). Therefore, discussion on creating new market mechanisms (NMMs) has mounted (UNFCCC 2019). NMMs are meant to provide economic, sector-wide emission reductions instead of ad hoc, project-based reductions and avoid the flaws of the CDM.

Development of the CDM

The CDM was established in 1994 along with the Kyoto Protocol, and it came into force in 1995. The main operational guidelines of the CDM were accepted in November 2001 as part of the Marrakesh Accords.

Even though the Marrakesh Accords made it possible for developed country participants to adopt the CDM as a tool for climate change mitigation, the decision for participants to do so was not widespread. In 2004, the Government of the Netherlands and the World Bank accounted for a third of the total number of CDM project transactions (Lecocq and Ambrosi 2007).

Originating from EU Directive 92/57/EEC (OJ L245, 26.8.92), the CDM 2007 regulations were introduced to combine welfare requirements with existing Construction (Health, Safety, and Welfare) Regulations under the CDM umbrella. The first commitment period of the Kyoto Protocol, which ran from 2008 to 2012, aimed to set the pace for achieving binding emission reduction targets. Industrialized countries were urged not to exceed dangerous levels of GHG emissions.

A second commitment period was established in 2012 in Doha. The period, which ran from 2013 to 2020, limited the use of CDM only to least developed countries. However, since the second commitment period ended on December 31, 2020, the CDM has been left with an uncertain fate.

NMMs were presented at the end of the first commitment period. Discussion on reforming the flexible, market-based mechanisms under the Kyoto Protocol began in 2007 in Bali. At the 2011 Durban Climate Change Conference, parties established “new market-based mechanisms” to make mitigation actions more affordable.

Structure of Governance

The UNFCCC set up a system of governance for the CDM, as presented in Fig. 1. CMP represents the Conference of the Parties serving as the meeting of the Parties to the Kyoto Protocol.

The CDM Executive Board, guided by the CMP, oversees the CDM process. The board is

fully liable to the CMP. It brings CDM project participants together for the registration of projects and issuance of CERs.

The Methodologies Panel develops recommendations for the board on guidelines for methodologies for baseline and monitoring plans and prepares recommendations on submitted proposals for baseline and monitoring methodologies. Host countries designate a national authority to authorize and approve participation in CDM projects. The designated operational entity is an independent auditor accredited by the CDM that validates project proposals and verifies GHG emission reductions.

Challenges

The CDM has allowed for climate change mitigation while providing developing countries with opportunities to engage in the global carbon market. However, it has been criticized for high transaction costs, ignoring the aim of sustainable development, complexity in verifying a project's additionality, and unequal distribution of projects across host countries, which leads to unequal distribution of project benefits (Boyd et al. 2009).

The capability of CDM projects to reduce GHG emissions cost-effectively and promote sustainable development in countries with economies in transition has been questioned (Dechezleprêtre et al. 2009; Olsen 2007). Researchers have identified trade-offs between the two aims of CDM. For example, CDM projects often favor the cost-effectiveness of certain mitigation actions over sustainable development in countries with economies in transition (Huang and Barker 2008; Kolshus et al. 2001; Olsen 2007; Olsen and Fenhann 2008; Paulsson 2009; Sutter and Parreño 2007). Market forces have not been able to support sustainable development in host countries. If developing countries continue participating in international climate collaboration, the impacts of CDM projects on sustainable development in countries with economies in transition should be recognized and reported.

The CDM has suffered from the unequal geographic distribution of projects, due to high

Clean Development Mechanism (CDM), Fig. 1 Governance structure of the CDM. (Adapted from UNFCCC)

demand for inexpensive emission reductions. Less than one fifth of CDM projects are hosted outside of the Asia-Pacific region; China hosts more than half of all CDM projects and India hosts one fifth of all CDM projects. The rest of the participating developing countries share less than 5% of CDM projects (Watts et al. 2015).

Watts et al. (2015) concluded that the CDM registry process is too ambiguous, which makes verifying additionality extremely complicated. The process has also been criticized for being too inflexible and requiring too much unavailable data for measuring baseline and project activity.

Additionality means that emission reductions from CDM projects should be additional. In other words, the emission reductions would not have occurred without the CDM project. However, the CDM requirements for additionality might discourage host countries from implementing ambitious renewable energy policies. If a host country already has ambitious policies for renewable

energy development in place, verifying the additionality of a CDM project becomes complicated. One of the verification issues is called double counting, which occurs when two different projects receive CERs for the same contribution. For example, if a project spans two different geographic areas, its climate benefits might be counted twice, and both areas might receive the CERs.

Lessons Learned from the CDM

The Kyoto Protocol is missing a clear-cut technology transfer mandate, and, according to Kim et al. (2013), technology transfer to host countries has not been significant. Certain desired technologies have been found to be “neglected” by the CDM. Technology transfer appears to be essential to reducing GHG emissions in developing countries, and local technological capabilities can play a significant role (Kim et al. 2013).

Maraseni and Cadman (2015) argued that the CDM has not achieved the expected emission reductions since 2008. At the end of the first commitment period of the Kyoto Protocol, there was a great financial crisis. In addition, a lack of commitment from industrialized countries, such as the USA, led to the dramatic drop of carbon prices. The current climate finance regime has not been able to support the participation of developing countries and the investments in the least developed countries (Hannam et al. 2015).

According to Watts et al. (2015), the CDM has not achieved sustainable development because the assessment process for CERs is biased and lacks universal standards. The United Nations lacks an accurate and accepted evaluation for sustainable development, despite the fact that the pursuit of sustainable development varies from country to country.

Subbarao and Lloyd (2011) argued that the existing architecture of the CDM has not delivered the expected benefits, especially for rural areas. Agriculture projects are scarce under the CDM, and due to high transaction costs, there is a lack of access for the poor, smallholders, and other vulnerable rural communities. However, smallholders could be included in the global carbon market through specific cooperative initiatives (Kahiluoto et al. 2012).

Successful projects involve and empower local communities. They are often managed in cooperation with local people rather than international companies. Involving local stakeholders and communities in the CDM may increase the probability of real development in host countries. Renewable energy CDM projects that are small-scale, rural, and community-based could be especially beneficial for sustainable development.

One of the successes of the CDM is the mobilization of investment. The mechanism has succeeded in engaging the public and private sectors of developed and developing countries in climate change mitigation. In addition, the CDM could increase the energy security of host countries with the help of a well-developed renewable energy strategy (Doukas et al. 2009).

Summary

The CDM was established in 1994 along with the Kyoto Protocol, with the dual aim of improving sustainable development in countries with economies in transition and providing affordable emission reductions for industrialized countries. It is one of three flexible mechanisms under the Kyoto Protocol for achieving the targets of the UNFCCC, along with Joint Implementation and International Emissions Trading. The UNFCCC has been criticized related to CDM project management, complex verification of additionality, inadequate sustainable development benefits, and unsatisfactory geographical distribution and permanence of projects. Also, high transactions costs have led to low accessibility to the CDM for the poor, smallholders, and other vulnerable rural communities. CDM projects have been criticized for being ad hoc and unable to accomplish profound change within the global energy system. While actual contributions to sustainable development and emission reductions have been debated, the CDM has been successful in mobilizing funding for climate change mitigation.

CDM; Flexibility mechanism under the Kyoto Protocol; Market-based mechanism

Definition

The Clean Development Mechanism (CDM) is one of the market-based mechanism given in the Kyoto Protocol which allows developed countries (Annex I) to achieve their binding emission reduction or limitation targets in a cost-effective manner. Under CDM, an Annex I country can implement an emission reduction project in a developing country where the cost of implementing such project is relatively lower. Each CDM project goes through a cycle of approvals and validations by a designated operating entity and a designated national authority before it is registered by CDM executive board. The developed country earns Certified Emission Reduction (CER) credits through these CDM projects. “Each CER is equivalent to one tonne of CO₂. These CERs can be traded and sold, and used by industrialized countries to meet a part of their emission reduction targets under the Kyoto Protocol” (UNFCCC 2020a). Thus, CDM provides developed nations some flexibility in how they meet their commitments under the Kyoto

Protocol while assisting developing countries in achieving their development goals in a sustainable manner and in participating in international efforts to mitigate climate change.

Introduction

In the past few decades, global warming and the resultant climate change have become one of the most pertinent global problems. Increasing legal and social pressures along with growing scientific evidence about the adverse impact of many human activities on the global climate system have led to combined international efforts since mid-1980s to deal with this grave situation. “In 1988, the United Nations Environment Programme (UNEP) and the World Meteorological Organization (WMO) established the Intergovernmental Panel on Climate Change (IPCC) to provide policymakers with authoritative scientific information” (UNEP 2008). This information can be used by countries in making their climate policies (IPCC 2020). United Nations Framework Convention on Climate Change (UNFCCC) was adopted in 1992 with the objective of “stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system” (United Nations 1992). At third Conference of Parties (COP3) to the Convention held at Kyoto, Japan, Kyoto Protocol was introduced. The main aim of the Kyoto Protocol was to reduce GHG emissions by setting internationally binding emission reduction targets. The target for the first commitment period (2008–2012) was to reduce the collective emissions of six GHGs by developed countries by at least 5% of 1990 levels (United Nations 1998). Most of these reductions had to occur within the national borders largely through national measures. In addition, to help developed countries to achieve their targets in a cost-effective way, the Protocol provided for three market-based mechanisms: “Joint implementation (JI), Clean Development Mechanism (CDM), and International Emission Trading” (UNFCCC 2007). Thus, CDM is one of the market-based mechanisms for achieving GHG reduction targets in a cost-effective manner.

According to Article 12 of the protocol, “the CDM allows emission-reduction (or emission removal) projects in developing countries to earn certified emission reduction (CER) credits, each equivalent to one tonne of CO₂. These CERs can be traded and sold, and used by industrialized countries to meet a part of their emission reduction targets under the Kyoto Protocol” (UNFCCC 2007). The reasoning behind CDM is that since it makes no difference where a ton of CO₂ or other GHG is reduced, the emission reduction targets can be achieved in the developing countries where cost of implementing emission reduction projects is relatively lower. For these projects, the funds and technology are given by the developed nations. Thus, the CDM seeks to match funds and technologies of industrialized nations with reduction opportunities in the developing countries so as to produce a cost-effective GHG reduction strategy.

Benefits of CDM

According to Article 12.2 of the Kyoto Protocol, “the purpose of the Clean Development Mechanism shall be to assist Parties not included in Annex I in achieving sustainable development and in contributing to the ultimate objective of the Convention, and to assist parties included in Annex I in achieving compliance with their quantified emission limitation and reduction commitments under Article 3” (United Nations 1998). For the developed countries, CDM projects earn tradable, saleable CERs which can be used by them to meet a part of their binding commitments under the Kyoto Protocol.

Emission reduction CDM projects may include energy efficiency improvement projects, renewable energy projects like solar water heating or wind energy projects, fossil fuel switching projects, projects for reducing agricultural emissions, reduction in industrial process emissions, sink projects for afforestation and reforestation, land-fill gas projects, etc. Developing countries usually lack both financial and technological resources to undertake these projects. These funds and technology can be provided by the industrialized

nations. It helps developing countries in participating in the international efforts to mitigate adverse impact of climate change and, at the same time, in meeting their social, environmental, and economic goals.

Thus, CDM projects lead to various economic, social, and environmental benefits for the developing countries. These include:

- Procurement of funds from the industrialized nations for major emission reduction projects
- Transfer of technology in the developing country to replace existing fossil fuel technology with new environmentally sustainable technology
- Accelerated economic activities
- Skill enhancement
- Creation of employment opportunities
- Other social benefits like self-sufficiency, poverty alleviation, balanced regional development
- Better standards of living and improvement in quality of life of communities
- Environmental benefits like cleaner air and water, improved land use, energy efficiency, reduced dependence on fossil fuels, reduced soil erosion, protected bio-diversity

CDM helps in raising climate funds which can be used to combat climate change and protect the earth. Some portion of the CERs generated through CDM projects is contributed to adaptation fund. According to Article 12.8 of the Protocol, “The Conference of the Parties serving as the meeting of the Parties to this Protocol shall ensure that a share of the proceeds from certified project activities is used to cover administrative expenses as well as to assist developing country Parties that are particularly vulnerable to the adverse effects of climate change to meet the costs of adaptation” (United Nations 1998).

Governance

The CDM projects are monitored by an executive board. The CDM executive board is the central authority for CDM projects, and it works under

the authority and guidance of the CMP (conference of parties serving as meeting of the parties) to the Kyoto Protocol (UNFCCC 2020b). The executive board accredits independent organizations to operate as designated operating entities (DOE). The DOE validates that proposed CDM projects meet the prescribed requirements of the CDM and submit these projects with the executive board for the registration. It also verifies the actual emission reductions from these projects and requests CDM executive board to issue CERs. In addition to DOE, designated national authorities are appointed for each host country which give national approval to the proposed CDM projects. Another important task of the CDM executive board is to develop and maintain a CDM registry as per the requirements of the Protocol (UNFCCC 2020c). The purpose is “to ensure the accurate accounting of the issuance, holding, transfer and acquisition of CERs by Parties” (UNFCCC 2020b). The executive board is supported by various panels and teams like methodology panel, registration, and issuance panel which assist and guide the board and make recommendations on various relevant issues.

CDM Project Cycle

In order to participate in the CDM, there are three basic requirements: “Voluntary participation in the CDM, the establishment of National CDM authority and ratification of Kyoto Protocol” (UNEP 2008). In addition, Annex I parties must meet some requirements like national system of estimation of GHGs, national registry, preparation of annual GHG inventory, etc.

Before registration, a CDM project has to go through a series of steps (UNEP 2008). The CDM cycle starts with the identification of a potential CDM project and checking its feasibility and additionality. A project design document (PDD) is prepared by the project participant. The document contains all the relevant details about the project including the proposed methodology, monitoring methods, timeline, expected environmental impacts, etc. The details are submitted with the Designated National Authority of the

host party for securing its approval. The project is also independently evaluated by a Designated Operating Entity (DOE) to see whether it meets various requirements of the CDM as mentioned in the protocol or prescribed by the executive board. Once the project is validated by the DOE, it is submitted with the CDM executive board for registration. The executive board, after checking all the details, may grant registration or ask for review of the project.

After registration of the project, the project can be started. During lifetime of the project, actual emissions are regularly monitored by the project participant using the approved methodology. The participant prepares a monitoring report stating the claimed emission reductions. The monitored reductions are independently verified by the DOE. The verification report is submitted to the executive board. The Board then issues CERs to the project participant. These CERs can be traded in the carbon markets or used by developed nations in meeting their binding commitments under the Kyoto Protocol.

Additionality Criteria

For qualifying for accreditation under CDM, the project participant must prove additionality. Additionality means that the proposed CDM project would result in emission reductions which would not have been occurred in the absence of that project (United Nations 1998). In other words, the project should lead to additional emission reductions. The actual emission reductions from a CDM project are also certified on the basis of this additionality. For this purpose, the emissions are compared to the baseline reference range which is established by the participant using an approved methodology for that particular sector or project. The project participant is required to prove that the emission reduction would not have happened under a usual business scenario. For example, in an area where only fossil fuels are used for the generation of electricity, any project that uses renewable energy would be deemed to be additional. “It is likely that the large majority of

the projects registered and CERs issued under the CDM are not providing real, measurable and additional emission reductions” (Cames et al. 2016). However, CDM is considered to be one of the important tools under the Kyoto Protocol to meet climate change mitigation goals, and it is expected that an analysis of CDM functioning may pave way to build mechanisms to meet targets given in the Paris agreement (UNFCCC Nav 2018). In 2020, there were over 7800 registered CDM projects with issuance of more than 2 billion CERs for project activity (UNFCCC 2020d). China dominated the scene with about 50% of the projects in September 2020, while India hosted about 20% of the projects (UNFCCC 2020e).

Summary

The Clean Development Mechanism is one of the flexibility mechanism defined under the Kyoto Protocol which allows Annex I countries to start emission reduction projects in developing countries in order to earn Certified Emission Reduction (CER) credits. These CERs can be used by these countries in meeting their national targets. The CDM is based on the logic that cost of reducing emissions may vary from country to country, but the benefit of emission reduction for the atmosphere will be the same irrespective of where the emission reduction action is taken. The industrialized countries can implement emission reduction projects in the developing countries where the cost of implementing such projects is comparatively lower. This also has the benefit of accelerating green investments and technology transfers in the host countries and of promoting sustainable economic development in different parts of the world.

Definition

Climate change is a measurable systemic change in the state of the climate driven by natural events or anthropogenic activities that alter the composition of the atmosphere.

Earth Is Undergoing Human-Induced Climate Change

Widespread and large climate changes such as an increase or decrease in the mean temperature and extreme weather events like severe storms have occurred repeatedly throughout the history of earth (Petit et al. 1999). Such changes can have natural causes, or they can be triggered by humans (Alley et al. 2003). They are related to variations in the composition of the atmosphere, in particular the concentration of greenhouse gases such as

water vapor, carbon dioxide, nitrous oxide, methane, and ozone. The consequential changes are called the greenhouse effect. It can be defined as the "...exchange of incoming and outgoing radiation that warms the earth..." (Lalliana 2018). The greenhouse effect was first identified by Svante Arrhenius in 1896 (Arrhenius 1896). Today, it is distinguished between the natural and the human-induced or increased greenhouse effect. While the natural one is change caused by natural processes, the human-induced greenhouse effect is a recent occurrence initiated by human activities (Koh and McCarthy 2018; Nica et al. 2019).

According to the international scientific community, the dominant cause of the current global warming is human activities (Cook et al. 2013; Caldeira 2012). Expanding economies and population growth threaten to collide with a finite Earth – its resources, fragile ecosystems, and the ability to absorb greenhouse gases. In particular the burning of fossil fuels, deforestation, land-use practices, and industrial processes have led to an enormous increase in the concentration of greenhouse gases in the atmosphere (Edenhofer and Jakob 2017).

Most climate scientists agree that human activities cause climate change (Kovaka 2019). Human-induced climate change can accordingly be described as one of the biggest policy challenges of humankind, for example, in health policy (e.g., issues regarding access to clean water, growth in heart-related illnesses, reduction in agricultural production) (Edenhofer and Jakob 2017). According to Milfont et al. (2017) "the public's belief in climate change and its human cause are increasing over time." More often citizens agree that climate change is real and is caused by humans and that action is needed to reduce the impacts of climate change.

The question is therefore not whether if human-induced climate change is real, but how to respond to its impacts (Brooks 2013). Two possible approaches are mitigation and adaptation. According to Lackner (2017), mitigation is "a human intervention to reduce the sources or enhance the sinks of greenhouse gases" (Lackner 2017, 3232), while adaptation is the "adjustment

in natural or human systems in response to actual or expected climatic stimuli or their effects, which moderates harm or exploits beneficial opportunities" (Lackner 2017, 3270).

Failure of climate-change mitigation and adaptation with the following extreme weather events is the top global risk to the future in terms of likelihood and the second biggest risk in terms of impact right after weapons of mass destruction (WEF 2019, 5). Climate change poses a risk to material well-being, food security, and personal health (Levine and Kline 2017; Obradovich et al. 2018). It reduces economic welfare and has severe effects on the stability of the financial system (Dafermos et al. 2018; Obradovich 2017).

Thus, climate change represents one of the greatest public policy challenges because "rapid global warming could serve to increase the likelihood of large, abrupt, persistent, and to some extent unpredictable, changes" (Alley et al. 20,013). According to Maximilian Auffhammer, the slow public policy response to climate change is "the biggest environmental market failure in human history" (Auffhammer 2018, 33). A logic response would require an understanding of the external cost imposed by a series of sub-issues, such as mitigation, adaptation to climate change, and emissions from land use, while at the same time touching upon numerous other policy fields such as biodiversity, trade, transportation, energy, health, migration, and the north–south divide (Brown et al. 2018).

Climate Change as a Regional and Temporal Problem

Climate change is a complex problem (Rittel and Webber 1973; Funtowicz and Ravetz 1993) with uncertain consequences (Filho et al. 2018). Complexity and uncertainty are associated with regional and temporal features of the phenomenon.

First, regional challenges are related to the geographical particularities associated with climate change. Climate change is a global phenomenon with local consequences that evolve as a consequence of local emissions (Auffhammer 2018). High-income areas often have the largest emissions per capita (Roberts and Parks 2007). They are less

vulnerable to climate change due to economic, governance, and social adaptations readiness. Opposite to this, developing countries are often victims of the global warming even if their own emissions are not high (Sarkodie and Strezov 2019; Watson et al. 2013). This is an ethical challenge.

Second, temporal features refer to the multi-generational impacts of climate change. In practical terms the global warming crosses generations so that people who will be most affected by its consequences have not yet been born. The current generation is pushing the costs of climate change onto future generations. This free riding occurs because “most of the benefits of costly emissions reductions today would accrue many decades in the future” (Nordhaus 2019) as greenhouse gases are long-lived. Consequently, humanity commits future generations to living with the consequences of climate change such as temperature and sea-level rises (IPCC 2019).

Solutions to the Climate Crisis

Taking care of the living conditions of the present and future generations is difficult because climate change is a phenomenon with uncertain consequences moving forward relatively slowly. Nevertheless, mitigation and adaptation strategies are applied to reduce the impacts of climate change.

Three strategies to mitigate climate change are (a) reducing emissions, (b) removing emissions from the atmosphere, and (c) increasing reflectivity of the Earth by solar-radiation management. Of those strategies, the reduction of emissions is the most feasible way to combat global warming (Nordhaus 2019). However, complex interdependencies among environmental change and socioeconomic development are challenging possibilities to reduce emissions. Additionally, different national governments have varied opinions about climate change and its possible consequences as well as mitigation and adaptation strategies. This is expressed in the climate agreements such as the Kyoto Protocol or the Paris Agreement (e.g., Held and Roger 2018).

According to Nordhaus (2019) “nations can overcome the syndrome of free riding in

international climate agreements if they adopt the club model rather than voluntary arrangements.” A climate club is an agreement between countries to undertake harmonized emission reductions. The central new feature is that nations would be penalized if they do not meet their obligations (Nordhaus 2019; Potoski 2017.) Furthermore, public awareness and the perceived threat of climate change are associated with governmental mitigation targets. Therefore, public awareness is and will be an essential part of garnering the support required for policies designed to mitigate and adapt to climate change (Drummond et al. 2018). In practical terms, 5% of the world GDP is needed for 20 years to solve the climate problem. A carbon tax could be levied at the coal face, oil well, and gas pipeline entry points. With that money 5% of the workforce and capital would shift to production of climate-friendly goods and services (Randers 2012).

Overall, it seems that a more holistic systemic approach is needed. Systems thinking is associated with a holistic worldview. This means that the world is interpreted as an integrated whole rather than as a collection of parts (Capra 1996). Climate change should be addressed with such a systemic thinking approach.

Future Directions

Systemic sustainability science helps to meet the great environmental and development challenges of this century (Kates 2011), including climate change. In particular solutions-oriented research could be further emphasized in sustainability science to move forward (Sarewitz et al. 2012; Wiek et al. 2012). This is important because time is running. Evidence is mounting that climate tipping points could be much sooner than was thought. The consequent changes will “have high impacts and are interconnected across different biophysical systems, potentially committing the world to long-term irreversible changes” (Lenton et al. 2019).

These tipping points are, for example, ice loss acceleration in Greenland, the East and the West Antarctic, fires and pests destroying boreal forests, or frequent droughts and severe bushfires in

Australia. As well as undermining humanities life-support system, biosphere tipping points can trigger additionally abrupt carbon release back to the atmosphere. According to Lenton et al. (2019), “this can amplify climate change and reduce remaining emission budgets. If damaging tipping cascades can occur and a global tipping point cannot be ruled out, then this is an existential threat to civilization.” The consideration of the tipping points makes clear that humanity lives in a climate emergency, and this strengthens “calls for urgent climate action – from schoolchildren to scientists, cities and countries” (Lenton et al. 2019).

Climate change adaptation; Coastal resilience

Definition

Climate change adaptation is an approach that aims to address the consequences of climate change and produce solutions quickly and easily. Through history, coastal cities were preferred for settlement due to their distinctiveness in ecosystem diversity, their potentials for offering rich and diverse activities, as well as for being rich trade and extensive tourism centers. Coastal cities are dense areas, and sea level rise due to climate change is one of the major threats for coastal cities since climate change can cause sudden storm surges, sea level rises, intensifying frequency and intensity of precipitation rates, and extreme temperature increases. In addition to negative impacts on ecological diversity and economic sectors, such as agriculture and fishing, climate change is a threat for the cities in terms of physical, spatial, functional, social, and economic aspects. The spatial and functional impacts of sea level rise in coastal cities are evident mainly on infrastructure systems, historical-cultural heritage, and biodiversity. One of the approaches against the risk of climate change is mitigation, which focuses on eliminating the causes of this problem. Alternatively, adaptation looks for solutions to live with and adapt to climate change in the long term. While global warming due to climate change is among the most critical environmental problems in the twenty-first century, the biggest challenge in taking measures against climate change effects is the uncertainty of its risks. Generating and implementing long-term action plans depend on both the availability of reliable data and a committed and flexible governance structure.

Background

In the 1960s, the damage caused to the environment and ecological concerns triggered awareness and the environmental movement, leading to international public awareness during the 1970s. While the increasing impacts of climate change, such as extreme weather events, flooding, heavy rainfalls, higher temperatures, began to disturb

cities, adaptation to these impacts became crucial. The talks during the United Nations Stockholm Conference (1972) emphasized that the tripartite relation between environment-economy-social developments should enter the public agenda as a priority. During the Rio Conference (1992), it is underlined that cooperation between governments, sectors, and nongovernmental organizations should be developed in order to establish novel global partnerships for protecting the global environment and development system (United Nations 1992). Actions promoting adaptation included the integration of climate information into broad development strategies, macropolicies, sector policies, institutional/organizational structures, or in development project design and implementation (Burton and van Aalst 1999). In the United Nations Conference on Human Settlements (Habitat II) (1996), the need to develop fundamental infrastructure services and urban planning within the scope of sustainability objectives is emphasized (United Nations 1996).

The issues on climate change vulnerabilities or adaptation require integrated structure of related government policies on water management, disaster vigilance, emergency planning, and land-use planning. Even if the impacts of climate change are uncertain, future scenarios can help to develop adaptation strategies. In some cases, early implementation of adaptation measures could be more cost-effective, especially for infrastructure with long economic life (Shukla et al. 2004). The IPCC Third Assessment Report (2001) showed that adaptive capacity is influenced by not only economic development and technology, but also social factors of human capital and governance structures. The literature on the institutional requirements for adaptation suggests that public policy has an important role in facilitating adaptation to climate change. This includes reducing vulnerability of people and infrastructure; providing information on risks for private and public investments and decision-making; and protecting habitats, species, and important resources.

In 2010, the United Nations Office for Disaster Risk Reduction (UNISDR) published a report which contains strategies both to promote an increased understanding and commitment by local governments in cities against risk reduction, and to

build cities that are sustainable, and resilient to disasters and climate change. These strategies include maintaining up-to-date data on hazards and vulnerabilities, preparing risk assessments, and using these strategies as the basis for urban development plans and decisions. The actions, taken by the local governments concerning the ideas for sustainable cities until today, have been as follows: investing in and maintaining critical infrastructure to reduce risk; assessing the safety of schools and health facilities and upgrading them whenever necessary; applying and enforcing realistic, risk-compliant building regulations and land use planning principles; preparing educational programs and trainings on disaster risk reduction in schools and local communities; developing protecting systems for ecology and natural buffers to mitigate floods, storm surges, and other hazards to which cities may be vulnerable; installing early warning systems and emergency management capacities in cities and holding regular public drills; and ensuring that the needs of the survivors, and supporting them and their community organizations to design and help implement responses, which include rebuilding homes and livelihoods after disasters.

The related literature shows that the studies on adaptation for coastal cities focus mostly in the local scale. There are a number of guidebooks, which outline the situation or offer adaptation strategies, prepared by various institutions and organizations against both the threat of climate change and the sea level rise in Europe, America, and Asia. They vary in the size of cities they discuss, the audience they address (i.e., specifically urban planners or policy makers), the offered impact scenarios, the benefits of adaptation, and the scenarios regarding physical, spatial, and social aspects. The adaptation strategies can be delineated in a number of steps, including to create risk maps showing the areas at risk regarding the possible amount of sea level rise, to make land use plans and converting them according to the implementation strategies by local municipalities, and to inform and assist communities in identifying potential alternatives for adaptation strategies. The possible effects of climate change and the possible adaptation strategies in coastal areas can be investigated in five different scales (Table 1). From macro to micro, they cover global (the entire

world), regional (a broad geographical area), national (the whole country), urban (built urban environment), and architectural (buildings and coastal structure) scales.

Adaptation strategies could be developed by individuals; however, other types of adaptation – mostly in response to extreme climatic events – should also be planned for and implemented by

Climate Change Adaptation in Coastal Cities, Table 1 The possible impacts of climate change and the possible adaptation strategies for coastal cities in different scales (Adapted from Ercanlı et al. 2019)

	Possible impacts of climate change on coastal areas	Possible adaptation strategies in coastal areas
Global scale	Unawareness from climate change effect Difficulties of estimating uncertain climatic events Lack of international coordination	Increasing public awareness Developing action plans against sea level rise risks Generating future scenarios Providing long-term and secured financial support Developing long-term and geographically extensive data sets Coordination between international organizations Reducing socio-economic effects of migration Developing disaster risk insurance policies
Regional scale	Economic inequalities Uncertainty in decision-making High costs for coastal management process Effects on coastal tourism	Founding regional organizations Supporting poor countries Long-term identification and assessment, adoption and funding implementation and evaluation Political commitment Vigilance Systematic knowledge of coastal resources Developing general adaptation strategies in the long term Considering adaptation while planning tourism areas in coastal cities
National scale	Socio-economic and cultural problems Lack of responsible departments and organizations Lack of future scenarios and adaptation strategies Lack of disaster risk policies and action plans Lack of regulations for risks due to climate change Necessity of interdisciplinary approaches Uncertainty for risky areas Lack of infrastructure	Education for public awareness Adapting regional action plans to national scales Developing scenarios and regulations Collaboration between stakeholders Developing projects with an interdisciplinary approach Determining risky areas and risk ratios Establishing of institutionalized substructure in regional ministries Revision of current coastal laws
Urban scale	Public unawareness Lack of national scenarios and plans Lack of flood risk management Unprepared local municipalities	Zoning urban areas Developing regional scenarios and plans Increasing public awareness and involvement Developing a flood risk management Educating occupational groups Disaster management Developing an action plan against sea level rise risks Developing specific plans for different natural coasts Specific department in local municipalities Identifying and involving governmental agencies and other stakeholders
Architectural scale	Lack of architectural and urban planning regulations Lack of local architectural strategies	Determining coastal land uses in accordance with risk analysis Revision of architectural regulations Generating alternative designs solutions for public spaces for possible sea level changes by local administrations

governing institutions on behalf of societies. Adaptation strategies can only be realized in a system, where different actors participate in an integrated structure. A variety of actors, including academic and scientific organizations, community-based organizations and small business, governments, international and nongovernmental organizations, large-scale industry or business, the United Nations, and international financial institutions, can implement adaptation strategies in ways that is not possible by only the city. Adaptation strategies by governments or public bodies usually involve actions to protect citizens together with their livelihoods, assets, and access to basic infrastructural services. Increasing local awareness and enhancing involvement can also be added as basic responses to cope with disasters and climate hazards.

Key Issues

The issues of human behavior and awareness are at the root of the problem of climate change (Marten, 2010). Public understanding of global warming can be predicted by a number of factors such as place attachment, receiving the local message, and gender. Changing the interaction of human beings with their environment relies on individual engagement and studies of personal and social factors such as childhood experience, knowledge and education, personality and self-construal, sense of control, values, political views and worldviews, goals, felt responsibility, cognitive biases, place attachment, age, gender, chosen activities religion, residence place, norms, social class, proximity to problem sites, and cultural and ethnic variations (Gifford and Nilsson 2014). Therefore, the biggest challenge of climate-change policy-making is mass communication. Culture and community are strongly related to place, therefore local knowledge and practices can be effective for adaptation. In addition, climate-related policies can be framed by policy makers and the media in terms of achievement of potential gains or in terms of avoidance in accordance with the

potential outcome and regulatory concern underlying the policy.

Another issue is that a hazard does not lead to a disaster if relevant policy responses are in place. The priority in developing policy should address: first, the issues of the absence of an immediate guaranteed payoff for risk reduction; second, the challenge of linking physical, social, ecological, and cultural disciplines; and third, the difficulty in assigning responsibility to one sector or ministry. While there are various studies in different aspects and different scales, their results are often not easily accessible to policymakers. An investigation on scenarios shows that while the decision makers in policy and practice typically do not use research-based knowledge sufficiently, the researches typically do not produce sufficient directly usable knowledge (Weichselgartner and Kasperson 2010). This is mainly because of the limitations of estimation tools that cause a wide range of scientific and socio-economic uncertainties. Besides, systematic observation schemes and data available for mitigating or adapting to climate change are lacking. Together with developing long-term geographically extensive data sets and sharing them in different scales, coordination is vital. Revision of current coastal law strategies, vigilance, planning, continually renewed political commitment, and considering adaptation options are necessary for planning coastal cities and developing proper strategies.

It is not merely enough to develop an action plan against risks due to climate change, to generate future scenarios, to provide long-term financial support, and to develop disaster risk insurance policies. Many coastal management plans either do not contain climate change adaptation measures or are not very effective. Their implementation requires establishing institutions that would bring together existing international organizations around the world to conduct coordinated work, lead countries' policies, and support poor countries for establishing institutionalized substructure in ministries. Other issues to consider include economic inequalities across countries in the responsibility for climate change, uncertainty in who will make decisions, balancing costs for

coastal management process, and decline of coastal tourism. Regarding the relative impact of climate change on rich and poor countries in terms of impact per capita and impact per GDP, it is argued that the poor countries are more susceptible to more damages. Moreover, lack of site-specific architectural and urban planning regulations needs to be remedied.

Summary

The biggest challenge in taking measures against climate change is the uncertainty of risks, and most of the studies are based on estimates and risk scenarios from one point of view, i.e., most of the studies conducted in the natural sciences consider the risks only within the limits of the discipline of the main authors. So far, risk analyses use deterministic ways against the annual average loss as a result of floods. Furthermore, sufficient number of strategies or action plans are not developed for the estimated future scenarios. There are almost no studies in the human sciences

that conduct an in-depth evaluation of the topic regarding human necessities; few studies partly relate to sociology, archaeology, and cultural studies. The topic can be investigated through more recent collaborative research between natural and human sciences such as ecology and economy, or geography and administration. As the spatial domain covers a broad range from the planning and design of cities, public spaces, and buildings, the risk is either rarely examined in the disciplines of urban planning and architecture, or hardly implemented in these scales. Therefore the reasons and consequences of adaptation should be addressed from a more comprehensive perspective that includes morphological, special, functional, and administrative issues together for designing future cities with climate-oriented approaches.

The possible effects of climate change and possible adaptation strategies against these effects can conceptually be discussed within three aspects: geographical/morphological (GM), administrative (A), and spatial/functional (SF) (Fig. 1). The effects (E) and adaptation strategies

Climate Change Adaptation in Coastal Cities, Fig. 1 Conceptual diagram according to multiple scales and aspects (adapted from Ercanlı et al. 2019)

(S) related to the geographical elements or physical forms of urban settlements are grouped in geographical/morphological aspects. Spatial/functional aspects are related directly to natural or built environment connecting with a function. Administrative aspects are related to the arrangements and work, which is necessary to control the operation of a plan or an organization. The aspects are grouped in five scales from macro to micro namely global (G) (the entire world), regional (R) (a broad geographical area), national (N) (the whole country), urban (built urban environment) (U), and architectural (A) (buildings and coastal structure) scales. Besides, each scale is interrelated with the other four and links the possible effects and adaptation strategies (Fig. 1) (Ercanlı et al. 2019).

In addition to conservation strategies and infrastructure proposals, studies and revisions in legislation are necessary for the development and implementation of adaptation strategies compatible with planning and zoning legislation. Besides legal regulations and strategy plans for all cities at the global scale, preparation and implementation of climatic strategy plans in which local municipalities are also stakeholders are necessary. Within the context of urban and architectural scales, more adaptation strategies and design approaches should be developed. Some of the steps for adaptation worth mentioning are generation of urban plans in accordance with local morphological and spatial features, designing multifunctional structures for adaptation of coastal cities, and enhancement of structures with materials as a response for sudden climatic changes.

IPCC; UN IPCC

Definition/Description

The United Nations Intergovernmental Panel on Climate Change (IPCC) is the international body for assessing the science related to climate change. Its main task is to provide policymakers with regular assessments of the scientific basis of climate change, including its impacts and the risks that climate change poses, as well as options for adaptation to and mitigation of climate change.

The Intergovernmental Panel on Climate Change is a body created by the World Meteorological Organization (WMO) and the United Nations Environmental Program (UNEP) in 1988 (Agrawala 1998). The IPCC is an organization that includes the governments of all member states of the United Nations and/or the WMO. According to IPCC's official website, it currently has 195 members (IPCC 2020b).

The IPCC does not conduct its own scientific research, rather it issues scientific assessments that aim to provide scientific foundation for governments to develop their policies for addressing climate change. According to the IPCC official statements, the assessments of the panel "are policy-relevant but not policy-prescriptive" (IPCC 2013a), therefore they aim to provide insight into processes on climate change, but do not prescribe any particular policy that should be implemented.

The IPCC assessments are written and edited by leading scientists in the relevant climate change fields that are voluntary contributors to the IPCC. The IPCC provides a platform for the research but authors deliver their personal professional opinions rather than represent the IPCC's.

Main Text

The IPCC is an intergovernmental body for scientific assessment of climate change. It is one of the organizations that are considered an emanation of the trend towards international policymaking, where national governments' authority is shifted towards institutions such as the United Nations (UN) (Gilland 2007). Aiming to provide an alternative and independent assessment on issues of

both global and local importance, the IPCC enhances the decision-making process and policy adoption.

History

The IPCC was created in 1988 (Zillman 2007). The creation of the Panel was a consequence of the uprising interest and debate in climate change that started in the middle of the twentieth century. Various research pieces and political incentives had already taken place by then, and interest in climate change in both policymakers and civil society was high. Some of the predeceasing structures and initiatives were the Advisory Group of Greenhouse Gases (AGGG), the Villach/Bellagio workshops, the 1986 SCOPE 29 Report of the International Council of Scientific Unions (ICSU), and the 1987 Report of the World Commission on Environment and Development (the Brundtland Report) (Agrawala 1998).

The practice of gathering scientists from different countries and various fields of study was already witnessing a rise (Gilland 2007), so the format of the IPCC was shaping to be one of a multicountry interdisciplinary approach to scientific assessment of climate action.

The Tenth World Meteorological Congress held in Geneva in May 1987 led to the WMO adopting a resolution, where countries agreed that the World Climate Programme, relying on WMO, the International Council of Scientific Unions (ICSU), and the United Nations Environment Programme (UNEP) are to address "all scientific aspects of global climate change, including the collection and analysis of data and the application of current knowledge to aspects of human endeavour" (WMO 1987, p. 124), while recognizing the necessity for an interdisciplinary scientific approach to assessment of climate degradation issues (WMO 1987).

The initiative was created with the support of the USA where discussions on climate change policies and action were taking place between various authorities (Agrawala 1998). Shortly after the initiative for creating an intergovernmental body for scientific analysis of

climate change was shaped, the UNEP joined the WMO initiative.

The main idea was to create an intergovernmental mechanism to provide scientific assessment of climate change, assist government bureaucrats with information, help come to the negotiating table, and better informed when it comes to decision-making (Agrawala 1998).

In this way in 1988 the WMO established together with the UN Environment Programme (UNEP) the Intergovernmental Panel on Climate Change (IPCC), and was given the task to scientifically evaluate the risk of climate change caused by human activity (Volger 2010).

Structure of the IPCC

The IPCC comprises of three working groups and one permanent task force on National Greenhouse Inventories. Sometimes, additional task groups might be created in order to facilitate certain projects (IPCC 2013a).

- Working Group I – thematic topics on the Physical Science Basis of Climate Change.
- Working Group II – thematic topics on Climate Change Impacts, Adaptation, and Vulnerability.
- Working Group III – thematic topics on Mitigation of Climate Change (IPCC 2013a).

The administration of the IPCC is headed by the Secretariat, headquartered in Geneva, Switzerland.

Major decisions of the IPCC are taken in plenary meetings. According to the Principles Governing IPCC Work, decision-making and administrative structures of the IPCC (like the Bureau, the IPCC Working Group Bureaux, etc.) should reflect a balanced geographic representation (IPCC 1998a). IPCC working groups and any task forces constituted by the IPCC shall have clearly defined and approved mandates and work plans as established by the Panel (IPCC 1998a).

Participation in the work of the IPCC is open to all WMO and UN member countries, and

invitations to participate in the sessions of the Panel, working groups, and task forces shall be extended to governments and other organizations (IPCC 1998a). The IPCC is to inform in advance governments or international organizations of the individual experts that have invitations extended to (IPCC 1998a).

According to Article 4 of Appendix B of the Principles that regulates the financing of the IPCC, the IPCC trust fund is administered by mutual agreement between the WMO and the UNEP, and “under the Financial Regulations of the WMO, consistent with the International Public Sector Accounting Standards (IPSAS)” (IPCC 1998c). Financing IPCC is made by members of the IPCC donating to the IPCC trust fund, and administered through the financial regulation of the WMO.

IPCC Reports

The IPCC assessments are based on peer-reviewed and published scientific literature (Volger 2010). IPCC assessments are written by leading scientists who volunteer as coordinating lead authors and lead authors of the reports. Hundreds of other experts provide complementary contributions by being associated as contributing authors.

IPCC reports undergo multiple rounds of drafting and review. The reports have appointed relevant teams of review editors which consist of experts, other from the authors (IPCC 2013b).

Experts from different areas covered by IPCC reports provide expertise as coordinating lead authors and lead authors. Contributing authors and expert reviewers provide specific contributions (IPCC 2013b). Contributing authors often are more than a hundred experts. Authors are selected on the basis of their relevant expertise after a call to governments and IPCC-related organizations (IPCC 2013b).

The process for selecting authors is described in Appendix A to the Principles Governing IPCC Work and its annexes (IPCC 1998b). Coordinating lead authors and lead authors have collective responsibility for the contents of a chapter, while

contributing authors, who often number hundreds, provide specific knowledge in a given area of expertise (IPCC 2013b).

According to Article 3 of the Principles Governing IPCC Work since the IPCC is an inter-governmental body, review of IPCC documents should involve both peer review by experts and review by governments (IPCC 1998a).

IPCC assessment reports cover scientific, technical, social, and economic aspects of climate change. The Assessment report is divided into four parts – one for each of the working groups. The fifth part of the assessment report is a synthesis report. So far five comprehensive assessment reports have been issued. The IPCC is currently in its sixth assessment cycle. The Panel will produce three special reports, a methodology report on national greenhouse gas inventories and the Sixth Assessment Report (AR6) throughout 2021 (IPCC 2020a).

Besides the assessment reports, the IPCC also issues special reports on specific topics related to climate change. Recent special reports include the Global Warming of 1.5 °C Report, Climate Change and Land Report, and the Ocean and Cryosphere in a Changing Climate Report.

IPCC also issues methodology reports that aim to provide guidelines for the preparation of greenhouse gas inventories.

The IPCC reports are focused on different aspects of climate change. IPCC reports are considered to be some of the scientific assessments that have an impact on decision-making and technical coordination between public authorities on both national and international level.

Whenever differing points of view are present in drawing assessments and reports, the IPCC is to provide information on these different opinions. Differing views on matters of a scientific, technical, or socioeconomic nature shall be appropriately represented in the document issued. If any differences of views on topics of policy and procedures are recorded in the Report of the Session (IPCC 1998a). Conclusions drawn by IPCC Working Groups are not considered official IPCC views until they have been accepted by the Panel in a plenary meeting (IPCC 1998a).

Criticism of ICPP

While the IPCC reports have been generally welcomed by governments and the vast majority of stakeholder groups, and widely used as a basis for informing national and international greenhouse policy development, both the IPCC and its reports have also been strongly criticized on both scientific and procedural grounds.

The IPCC has faced criticism in various fields. Partially because of its intergovernmental nature, it has been criticized that findings are determined by politics rather than by science, and that it has a political agenda that impedes scientific reason (Alexander 2007). Having an intergovernmental status has led to some difficulties in terms of IPCC assessment summaries being regarded as politically negotiated which, according to Agrawala, have at times undermined their credibility (Agrawala 1998).

Other major points of criticism that the IPCC has faced include statements that it consists of a self-serving research community talking up the climate change issue to attract research funding, and that it lacks expertise in key areas such as geology and economics. According to Zillman, some key working group co-chairs and lead authors have explicitly declined to identify future research needs without special pleading to the IPCC process (Zillman 2007). He notes that criticism has come particularly from some members of the geological community, and from some members of the economics community (Zillman 2007).

There has been criticism that the IPCC idea of consensus between science and governance structures (whether governments or local authorities) is inappropriate for science. When there is not full agreement amongst lead authors, the IPCC procedures provide mechanisms for informing policymakers on the strengths, or weaknesses, of that agreement (Zillman 2007).

Critics of the IPCC have emerged from various communities – from experts in the scientific community whose research has not been favorably assessed in IPCC reports, through scientists whose fields are not represented in the IPCC reporting, to business and other social actors who find the IPCC findings inconvenient (Zillman 2007).

Summary

The IPCC is an organization that aims to provide a better scientifically backed understanding of climate change and the socioeconomic processes, related to climate change. The organization has 195 member countries, which creates a pool of researchers and scientists that could under the supervision and support of the IPCC combine their efforts in contributing to climate change combating with their expertise.

[Ethics of climate change](#)

Definition

Climate ethics is a subfield of environmental ethics which focuses on the distribution of individual and collective duties and rights, burdens, and benefits pertaining to the causes and consequences of climate change. It tackles the moral issues embodied in the recent evolution of the Earth system and its future course. Due to the key role of humanity, especially since the onset of the industrial times, at the beginning of the nineteenth century, captured by the concept of *Anthropocene* (the age/epoch of humans), climate ethics deals with *Homo sapiens*' responsibility in the rise of climate-related harms, risks, and uncertainties. More precisely, it addresses the issues of (1) who is responsible for the current climate patterns, i.e., for emitting vast amounts of greenhouse gas; (2) how should the burdens and benefits be distributed, including carbon abatement; and (3) how to balance the interests of the present and the future generations. In sum, climate ethics articulates three aspects: *evaluative*, which is about ascribing responsibilities; *distributive*, which is about allocating the present and future costs/benefits; and *prescriptive*, which is about what to do for mitigating (cutting down carbon emissions) or adapting to climate change.

Introduction

Climate ethics principally deals with the adverse consequences of climate changes, viz., the increase of temperatures, the rise of sea levels, the acidification of the oceans, and the higher frequency of extreme weather events. Such changes are mainly due to human releases of staggering quantities of greenhouse gas (GHG), such as carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), and so forth, in the atmosphere, either directly (e.g., through fossil fuel combustion) or indirectly (e.g., through melting permafrost or leaks while exploiting oil and shale fields). As a result, global temperatures have been rising (with local variations) since the nineteenth century, at an accelerating rate starting from 1970. In its Fifth Assessment Report (IPCC 2013), the

Intergovernmental Panel on Climate Change (IPCC) estimated that temperatures have already climbed by 0.85 °C from 1880 to 2012. Temperatures have continued to soar during the 2010s.

This fast-paced increase is not leaving much time to animal and vegetal species for adapting or migrating to more clement latitudes or altitude. In addition, sea levels have been rising due to the combined effects of heat dilation, loss of ice in Greenland and Antarctica, and melting land ice masses (glaciers). By 2100, oceans could have risen between 30 cm and 111 cm, depending on the path followed by GHG emissions during the rest of the century (Wuebbles et al. 2017). Oceans have become more acidic, threatening coral reef and marine life (e.g., mollusks and some fish species). The exact amplitude of these changes is not totally clear since it depends, for a large part, on current and future emissions.

In the absence of drastic reduction of GHG emissions, the consequences for the humans and ecosystems will be severe. In addition to global warming, models have been predicting more frequent extreme weather events such as floods, heat waves, tornadoes, hurricanes, and droughts. These drastic conditions will threaten agricultural activities and human health. Exotic viruses (such as West Nile virus) and pests have started to spread from tropical to more temperate regions, creating public health hazards. More people will suffer from malnutrition and restricted access to water. Some zones will become inhospitable (e.g., coastal and arid zones).

These changes will generate serious environmental (e.g., loss of species), material (e.g., damages to public infrastructure, decline of economic growth), and human costs (e.g., diseases, deaths). Regions which are already vulnerable on ecological, economic, social, and political grounds (e.g., Africa, Pacific Islands) will be hit first and the harshest. International organizations such as the United Nations are expecting a sharp increase of migration.

The impact of climate change, combined with pollution, is so significant that scientists have proposed to rename the current geological epoch, *Holocene* (the new epoch), into *Anthropocene* (the age or epoch of humans). The

reason is that humanity has become the main geological force by releasing large amounts of carbon and other GHGs but also by polluting the land and sea with plastics, chemicals, and radioactivity as well as drastically altering the landscape (e.g., by diverting rivers, mining).

Considering its extent, climate change raises key economic, social, and political issues in terms of responsibilities, distribution of burdens, adapting, or preventing further worsening. The major issue concerns the intragenerational and intergenerational distribution of responsibilities and costs of mitigation (initiatives that aim at lowering GHG emissions and improve GHG sinks such as forests (IPCC 2007, p. 878)) and adaptation (intervention that attempts at adjusting human and natural systems to climate changes (IPCC 2007, p. 869)).

Climate ethics tackles these issues on moral grounds, i.e., from the perspective of the evaluation of the current state of affairs and the actions that could be required from different, global and local, actors ranging from individuals, municipalities, corporations to states and international organizations. It assesses the badness and wrongness of the situation while searching to address it while respecting principles such as responsibility, fairness, minimization of harms, and so forth.

Climate Ethics

Climate ethics can be understood as the reflection on (1) who is responsible for the current climate patterns, (2) how should climate changes' burdens and benefits be distributed, and (3) how to balance the interests of the present and the future generations. It spells out the specifics of human responsibility for climate-related issues in the Anthropocene. Since most of the current changes in the Earth climate are due to anthropic interference (mostly through greenhouse gas emissions), there is a need to reformulate moral responsibilities in proportion of such an interference. Climate ethics is to take the role of humanity in crafting the modern environment seriously.

Responsibility for Climatic Changes

The first issue can be summed up by *who is responsible for climate changes*. Despite the insistence on GHG emissions (and concentration) and the ensuing rise of temperatures, climate changes encompass more than those aspects. It refers to the swelling of sea levels (and the threat it represents for coastal populations), the higher frequency of extreme events (e.g., storms, hurricanes, floods, droughts, forest fires), or the acidification of the oceans.

Adverse outcomes also include massive extinction of animal species (Cebalos et al. 2017), which have been already threatened by human activities, the difficulty of plants to adapt, and so forth. If the cause of climate change is clearly identified as the accumulation of GHG in the atmosphere, the repercussions are broader and more serious than a few degrees on a thermometer.

Responsibility is a multilayered concept. It could be *causal* (when someone's actions have contributed to the current state of affairs), *material* (when someone is liable for the consequences of some actions or states of the world), *legal* (when someone is legally liable for some actions or states of the world), and *ethical* (when someone is considered as morally praiseworthy or blameful for some actions or states of the world).

The various dimensions of responsibility are connected. It is intuitively appealing to ground material, legal, or moral dimension in the causal one. This raises an important issue since material, legal, or moral aspects could be seen as stemming from causal one. For instance, if a car driver initiates an accident by making a bold turn, driving too fast, or being intoxicated, he should *ceteris paribus* bear at least some of the fallout in terms of costs, redress, compensation, and so on.

In the case of climate change, the rising temperatures, the acidification of the oceans, and the worsening of weather conditions (e.g., more frequent and intense hurricanes, droughts) have irrefutably been associated with the current GHG concentrations in the atmosphere. Carbon concentration has climbed from 280 parts per million (ppm) before the industrialization (end of the eighteenth century) to ca. 410 ppm in 2019, mostly due to fossil fuel combustion.

Indeed, humans are causally responsible for the bulk of the dramatic increase in GHG level. Moreover, a look at the main past emitters offers a finer-grained view. Since CO₂ release is tightly correlated to economic growth, nations are causally responsible for the present state of affairs in a direct proportion of their past development, which is mirrored by their affluence. Thus, causal and material responsibilities could be combined for backing up the assertion that industrialized countries ought to assume most of climate change-induced costs, which is at the foundation of the “polluter payer principle” (Gardiner 2010). This approach represents an instance of historic justice implying intergenerational responsibility in which the current generations in developed countries are being held responsible for the choices and actions of past generations.

Besides, it could be claimed that, in addition to bearing an important causal responsibility, the largest carbon emitters from a historical perspective, namely, the industrialized nations, are those who are more likely to have benefited from such release. As a result, they are the most capable of assuming the material consequences of climate change by compensating individuals and communities who are, and will be, suffering the most (e.g., low-rise Pacific Islands), by covering for the costs of adaptation (e.g., by building protective dykes, breeding plants resistant to droughts, supporting/hosting population relocation) or mitigation (e.g., by transferring technologies, financing the decarbonization of economies). This rationale captures the “ability-to-pay principle.”

Both principles – polluter payer and ability to pay – are formulated in article 3.1. of the 1992 United Nations Framework Convention on Climate Change (UNFCCC). Per se, the causal responsibility and the capacity to face a problem do not have to coincide. However, in the case of climate change, there is a robust overlap between the two. Additionally, it could be claimed that industrialized nations have created global negative externalities, passing part of the costs of their affluence onto less wealthy ones and future generations (more below).

In realpolitik, this topic is contentious. Developed countries (“Annex I parties” under the

UNFCCC) often search to downplay or escape their historic responsibility, which undermines any large-scale international agreement. A blatant example is the Kyoto Protocol (signed in 1997, entered in force in 2005), which aimed at reducing GHG emissions. As illustrations of this avoidance strategy, the United States signed but didn’t ratify the protocol, whereas Canada pulled out in 2012. Another occurrence is the Paris Agreement signed in 2016, in which most publicized target is to maintain the global temperature rise significantly under 2 degrees, preferably within a 1.5-degree range, and from which the United States decided to withdraw in 2017.

Developed countries (UNFCCC “non-Annex I parties”) contend that the trend of emissions has been shifting in the last two decades. Since the mid-2000s, China has become the main source of carbon, its total emission being over the United States and EU altogether. Other developing economies such as India have steeply increased their release, while many industrialized nations have kept under control or reduced their own (e.g., Russia and the European Union).

Developing countries usually stress that a glimpse at the emissions per capita offers a different picture where the United States and other industrialized nations are still the main polluters. Moreover, they oppose the *right to (sustainable) development*, as stipulated in the 25 September 2015 United Nations resolution adopted by the general assembly titled *2030 Agenda for Sustainable Development* (A/RES/70/1), initially formulated in the United Nations general assembly resolution 41/128 (4 December 1986). Therefore, humanity has to find a way of balancing, on the one hand, the necessity of carbon abatement, and on the other hand, the necessity to alleviate poverty and suffering (Moellendorf 2014).

Distribution of Harms and Benefits

The question of who is responsible for the situation but, more importantly, who is for tackling it underlines the issue of how the burdens (and potential benefits) of climate change ought to be distributed. Because one country or group of countries cannot be regarded as entirely responsible, there is the need for more granular rules or

principles. Considering only the material costs (e.g., loss of crops due to droughts, the relocation of population because of rising sea, migrations), should the costs be allocated in accordance to causality (past emissions) or capacity (affluence)? In other words, should such a distribution follow a polluter payer, an ability-to-pay principle, a mix of the two, or something else?

As stipulated above, the polluter payer and ability-to-pay principles mostly (still) overlap, but the situation is changing. This raises the further issue of global responsibility, which is captured by the fact that GHG emissions could be seen as *negative externalities*, i.e., costs imposed on third parties without their consent, disproportionally generated by few actors at the expense of everyone else, especially already vulnerable, less affluent populations. The language of negative externalities suggests that the main carbon polluters would have actually inflicted unacceptable harms for which they are materially and morally responsible and that would require some intervention, regulation, and, potentially, redress or compensation (Mill 1859).

In addition, it is probable that in the short run some areas will gain from the temperature increase. For instance, a broader variety of crops could be farmed in Scandinavia, the growing season might be extended, and tourism might develop in places which were previously inhospitable (e.g., the Arctic region). Since they directly stem from past emissions and happen concurrently with burdens (without even considering the fact that many of these benefits may occur in the most developed countries such as Scandinavia), how much those who are gaining from climate change should compensate the losers?

Such a question points at the necessity of widely agreed global justice mechanisms. Furthermore, it tackles the views that tie moral responsibilities to a principle of proximity, stipulating that duties vary in a direct, positive proportion with the degree of closeness (geographical, national, cultural) to the potential beneficiaries. As the proximity argument goes, it is the reason why moral bounds would be stronger among citizens than between citizens and foreigners. Due to its global scope as well as the uneven dispersion

of damages (less affluent parts of the world suffering the most), climate change challenges traditional stances about proximity as the core for duties, in particular of justice (for redress, compensation, or redistribution).

Climate change burdens humans, but not only. Nonhuman animals, plants, and arguably other organisms (as well as, perhaps, ecosystems) have also been adversely affected by the rise of temperature and the alteration of environmental conditions, some being independent from GHG emissions (e.g., destruction of natural habitats). When thinking about responsibilities, it is important to circumscribe the limits of the “moral community” or, in other terms, the entities who matter in the evaluation of a given situation (which could create duties on the human side).

The inclusion of animals, plants, and other organisms within human moral concerns appears in international texts, agreements, covenants, or declarations. For instance, the 1992 Convention on Biodiversity affirms the intrinsic value of biodiversity, i.e., the moral worth of living organisms cannot be reduced to their instrumental value for humans. If taken seriously, this implies that any discussion on climate change, its effects, and human responsibilities needs extent to other living organisms, their interests, well-being, and so forth, to an extent to be defined.

Part of the debates in climate ethics revolve around the issue of which value to attribute to nonhuman living beings. Should it be instrumental, as posited by anthropocentrism (which claims that humans and their interests are ultimately what morally matter), or should such a value be intrinsic, as usually defended by nonanthropocentric conceptions such as biocentrism (Taylor 1986)? Furthermore, should an inherent worth be given to ecosystems as wholes, as initiated by the famous conservationist Aldo Leopold (1949)?

Future Generations

The third initial question enlarges the horizon by including the future generations. If one considers that climate change results from concentration of greenhouse gas in the atmosphere released by past and current human beings and that its adverse effects will be constantly ramping in the future,

this implies that distant generations will have to face dangers that will mostly not be their doing.

Climate change thereby involves intragenerational externalities. GHG emissions could be interpreted as the inevitable side products of industrialization which, for sure, left future generations with excessive carbon but also, presumably, with higher quality of life, more advanced technology, more extensive public infrastructure (e.g., transportation, libraries, universities, hospitals), and so forth. In short, future generations will be, on the average, better armed for tackling mitigation and adaptation issues.

This argument is at the core of the *social time discount rate*, which is applied to the future costs of climate changes. Put differently, the interests of, benefits to, or costs incurred by future generations do not count as equal to current generations' ones. They are discounted when doing an intertemporal cost-benefit analysis. The rationale is because distant generations will be better prepared than the current ones for confronting climate change. They will have better science and technology, better equipment, and better information. They will also be richer, so they will be more capable of financing ambitious projects, for instance, in green energy or geoengineering deployment.

Therefore, it is morally permissible (and economically efficient) to invest only a small portion (depending on the discount rate) of the capital that will be required in the future for mitigating or adapting to climate change. Discounting is acceptable because future generations' ability to pay will be superior to the present ones. Furthermore, present sacrifices are reduced, which do not impede the right to develop of worse-off populations, e.g., in developing countries.

These arguments are at the core of the controversy between advocates of a low discount rate, represented by Nicholas Stern in his famous *Review* (2007), and advocates of a high rate (the interests of future generations count for less), such as William Nordhaus (2008). Stern claims that humanity should dramatically cut its emissions as soon as possible in order to prevent dangerous climate changes, whereas Nordhaus argues for

modest abatement first that will steeply ramp up further down the line, in decades.

This controversy highlights two key points. The first is the assumption about future generations' affluence. This is visible in Nordhaus' position. It is posited that future generations will be better off, which implies that no significant crisis will hit and provoke economic stagnation or depression. The second is that climate is assumed to follow linear patterns, which means that adverse events will be proportional to the increase in GHG concentrations. However, this assumption is contested by scientists. Many point out that climate does not tightly correlate with carbon emissions and will display a nonlinear variation.

On the one hand, it is clear that the climate does not react concurrently to CO₂ concentration. The impact is delayed, which explains why the current temperatures are below what they should be if we assume a strict and immediate correlation with GHG concentrations. For instance, the last time Earth experienced CO₂ concentrations ca. 415 ppm (parts per million), it was between 3 and 5 million years ago, during the Pliocene, when global temperatures were 3–4 °C warmer (Naish et al. 2009); in the Arctic, temperatures may have been 8 °C warmer (Brigham-Grette et al. 2013); Antarctica had forests (Rees-Owen et al. 2018); and the sea levels were probably between 10 and 20 m higher than nowadays. In sum, the current weather does not accurately reflect the underlying climatic change.

On the other hand, a great deal of uncertainty still exists about *tipping points*, which, if crossed, will make the climate unstable. Weather events will become increasingly unpredictable in terms of frequency and intensity. The tipping points usually identified by climate science (Lenton et al. 2019) include the massive release of the methane currently captured in the permafrost, the loss of West Antarctica and Greenland ice caps, the complete disappearance of the Arctic ice sheet, the shutdown of the thermohaline circulation, and so forth. Some of these tipping points are at higher risk to be crossed if temperatures climb beyond the 1.5 °C mark in comparison with pre-industrial time (IPCC 2018, pp. 282–283).

Thus, discussions about the social time discount rate involve reflections about risks and uncertainty. More precisely, it underlines the questions of which level of risk it is morally acceptable to take, especially if we consider that such risks might pile up dramatically as we advance in the future. That is the reason why the precautionary principle is mobilized as a justification for immediate and drastic mitigation, along adaptation. Both principle 15 of 1992 Rio Declaration on Environment and Development and article 3.3 of the UNFCCC posit that the prevention of “serious or irreversible” damages to the environment should not be impeded by the absence of “full scientific certainty.”

The prospect of “serious or irreversible” climate damages is magnified in the intergenerational perspective. By not drastically cutting down their emissions that present generations are creating risks for future generations, they externalize part of the burdens created by their lifestyle. There is also the risk that future generations might be literally locked in a dangerous and unstable climate for decades or centuries. This could be characterized as an instance of intergenerational *moral hazard*, where one party adopts riskier behavior because he knows that the detrimental consequences will be partly or totally assumed by another party.

The core issue raised by the third dimension can be summed up by asking: *what do present generations owe to future ones?* The situation could be seen as one of transmitting a pool of various resources which include natural resources, atmosphere composition, institutions, technologies, cultures, etc. but also harmful risks (adverse events about which science can provide fairly reliable probabilities) and, more importantly, uncertainties (unpredictable events with outcomes that are impossible to evaluate). In this context, a balance has to be found between which risks can present generations take for the sake of socioeconomic development without jeopardizing the interests of the individuals to come and other living beings. The issue is one of distributive justice, but under an amount of uncertainty that will depend on key choices about mitigation (e.g., choice of

technology, green energies, carbon removal) and adaptation.

Summary

Climate change is one of the most, if not the most, severe problems faced by humanity. It directly results from the release of CO₂ and other greenhouse gases (GHGs) in the atmosphere, especially since the onset of the industrialization. This origin explains why there is a correlation between the countries which omitted the most GHGs and those who are the most socioeconomically advanced. Climate ethics constitutes the attempt to think climate change from a moral perspective, which raises three issues. The first is to determine who is responsible for the current situation and its future evolution. The question is contentious since developed and developing countries disagree about historic responsibility but also about how should carbon abatement be divided nowadays. The second issue is about the distribution of the burdens and benefits of climate change. When doing such a review, it is important to determine whether to count the consequences to humans only or to include concerns for other living beings taken as instrumentally or intrinsically valuable. The third question deals with what current generations owe to future ones. It is captured by debates around the time social discount rate, which consists in deflating future generations’ interests, incurred costs, etc. because they will presumably be better off than present generations and, indeed, more capable of addressing climate change. Any discussions about a fair intergenerational distribution of burdens and benefits are obscured by the looming uncertainty of climate changes, especially when considering the probable existence of tipping points.

Definition

Climate finance refers to local, national, or transnational financing for climate change mitigation and adaptation of related activities drawn from public, private, and alternative sources. There is no single definition of climate finance. It is, in some instances, discussed separately but often integrated with related and overlapping concepts of green, sustainable, or low-carbon finance.

The United Nations Framework Convention on Climate Change (UNFCCC) has defined climate finance as “*finance that aims at reducing emissions, and enhancing sinks of greenhouse gases and aims at reducing vulnerability of, and maintaining and increasing the resilience of, human and ecological systems to negative climate change impacts.*”

This definition encapsulates climate finance in its broadest form, as it represents the funding of all activities and projects that take climate change mitigation and adaptation into account. A broad definition is necessary as climate finance consists of many different elements such as the type of financing that is provided, the source of financing, flows of financing, what is financed, and whether climate change mitigation is the major or minor element of the activity. Climate finance is, however, most often utilized in the context of climate change negotiation processes, wherein the aim is to provide additional financial resources from developed to developing countries for climate change mitigation and adaptation activities that are unlikely to occur without additional financing.

Introduction

Climate finance aims to provide the financial means for implementing the transition to a sustainable low-carbon and climate-resilient economy in line with the 2 °C goal set by the Paris Agreement on Climate Change. However, how the financing of the transition will be done is still an open question. In 1992, UN member states agreed that those responsible for climate change should compensate for caused emissions by

financing mitigation and adaptation activities. Global effort is needed as the contribution of countries to climate change, and their capacity to prevent it and cope with its consequences varies enormously.

According to the Climate Policy Initiative (CPI 2018), the global climate finance flows are increasing. The average annual flow of climate finance was USD 463 billion during 2015–2016. Private sectors, such as project developers, banks, and corporations, provided the major share of climate investments (54%) in the 2015–2016 period (Fig. 1). Estimates for finance flows in 2017 range from USD 510 billion to USD 530 billion. However, adaptation finance flows are estimated to be just USD 22 billion per year because of lack of private investments. The vast majority of investments (81%) were spent domestically during 2015–2016, and most of the international flows were from OECD to non-OECD countries. More specifically, the dominant international destinations were in East Asia and in the Pacific region during 2015–2016. Finance flows are mainly concentrated in the renewable energy sector (approximately USD 300 billion). Water and wastewater management projects are the largest sectors when it comes to adaptation finance, followed by agriculture, forestry, and land-use adaptation activities (CPI 2018).

To achieve the goal of limiting warming set at 2 °C in the Paris Agreement, global annual emissions need to be less than 42.51 GtCO₂ e in 2030, while 1.5 °C pathways annual global emissions need to be about three-quarters of that at 33.94 GtCO₂ e (UNFCCC 2019). The Intergovernmental Panel on Climate Change (IPCC) reports showing a USD 1.6–3.8 trillion requirement for further investments to sustainable energy systems to keep warming within a 1.5 °C scenario (IPCC 2018). In 2009, developed countries committed (COP15) to mobilize USD 100 billion annually by 2020 for climate action in developing countries. According to the UNEP Adaptation Gap report (2016), developing countries would need to invest between USD 140 billion and USD 300 billion per year by 2030 in order to adapt to a 2 °C future. This means that estimated costs are 9–19 times higher than current levels of international public

Climate Finance, Fig. 1 (a) Breakdown of global public and private climate financing during 2015–2016 (\$bn), (b) Average distribution of global climate finance between private and public flows during 2015–2016,

adaptation finance to avoid an adaptation finance gap in 2030 (Oliver et al. 2018).

Finance Mechanisms

In order to incentivize and hasten sustainable transformation, multiple mechanisms have been implemented. These mechanisms are divided into two main categories: voluntary and mandatory mechanisms. Mandatory markets are founded upon negotiation processes, which set regulatory requirements on the participants. The most prominent of these negotiation processes was the establishment of emissions trading under the Kyoto protocol. Each ratified country is set an emissions target and a corresponding number of allowances. Countries can meet their targets by limiting emissions or by purchasing carbon credits from countries that have a surplus of allowances. The Kyoto Protocol also established the so-called Flexible Mechanisms, the Clean Development Mechanism

(CDM), and Joint Implementation (JI), to increase cost-effectiveness of emission reductions. The CDM allows developed countries to partly meet their Kyoto targets by financing carbon emission reduction projects in developing countries. The aim, in CDM, is that the developed country can implement its reduction goals in a developing country, wherein it is the most cost-effective, while offering sustainable development benefits where the implementation takes place. JI works similarly to CDM, with the exception that the host country is a developed country as well (UNFCCC 2005). New market-based mechanisms are being developed (e.g., the new market mechanism (NMM)), but these mechanisms have not been codified yet (Gao et al. 2016).

A group of European countries created the EU Emissions Trading Scheme (EU-ETS), where allowances may be traded among participating countries. The EU-ETS began its operations in 2005 and is the largest emission-trading scheme. There are, currently, dozens of regional, national,

or transnational systems in the World, operating under or independently of the Kyoto Protocol. They have been established, for example, in Canada, in California, in the East Coast of the United States, and in eight Chinese provinces. China's national emissions trading scheme is expected to start operating during 2020 (Cao et al. 2019).

The voluntary carbon markets function independently from and additionally to the regulatory law and compliance markets, enabling private entities to voluntarily offset their emissions by purchasing offsets that were created either in the voluntary market or in the CDM. There are no established specialized rules and regulations, such as those set by the US Securities and Exchange Commission, for the stock exchange of the voluntary carbon market. This lack of overhead allows for innovation and experimentation, as projects can be implemented with fewer transaction costs than compliance market projects, making it feasible to also implement micro-sized projects. Conversely, the lack of quality control has led to the production of some low-quality credits, such as those from projects that would have likely happened anyway; thus, the offset credit produced does not always fulfill the additionality criteria.

Multilateral climate funds are one of several ways how climate finance flows are distributed. The climate funds play an important role in supporting vulnerable communities in developing countries to transform into clean technology and climate-resilient economies. More than 1000 projects are being funded by the four main climate funds: the Green Climate Fund (GCF), Adaptation Fund (AF), Climate Investment Fund (CIF), and Global Environment Facility (GEF). CIF accelerates climate action by empowering transformations in clean technology, energy access, climate resilience, and sustainable forests in developing and middle-income countries. While GCF finances both adaptation and mitigation projects, GEF is largely dedicated to mitigation. AF was established to finance practical adaptation projects and programs in developing countries that are parties of the Kyoto Protocol and are particularly vulnerable to the adverse effects of climate change. Most of the projects funded so far

by the leading funds are in Mexico, followed by India, Cambodia, and South Africa (CB 2017).

Lessons Learned

Climate financing has two relevant variables and stakeholder goals: monetary gain and emissions reduction, or sequestration amount. Thus, it is pivotal to consider the fact that mere climate-financing flow does not necessarily correspond to effective emissions reduction as the used monetary amount does not give an indication of how much carbon was abated. To achieve more transparency, climate financing flows should be connected and standardized according to the actual, measured climate effect whenever possible. Second, with standardization, the complexity of the climate financing could be simplified to a few key indicators that are the most important for the activity, usually monetary gain, cost, carbon reduction, and sequestration achieved. This transparency and simplicity would help ensure that the goals of different stakeholders are met and that decision-makers are selecting the best available methods and technologies to combat this difficult challenge. One successful decision-making tool when choosing and assessing carbon abatement measures has been the usage of marginal abatement cost (MAC) curves, which indicate the marginal cost of each additional unit of carbon reduction or sequestration. However, implementation from country to a smaller project scope is recommended so that utilization of the most efficient carbon solutions becomes an ordinary and habitual part of decision-making (Ibrahim and Kennedy 2016).

The carbon prices collapsed during the economic recession. Thus, the cost of carbon emissions was not significant enough to convince industries to invest in carbon reduction in accordance with national targets. Different mechanisms have been created to ensure carbon prices that incentivize investments in carbon reduction. In EU, the ETS carbon-trading scheme was reorganized to have a depository of excess carbon credits, which immediately increased emissions allowance prices. The prices climbed up to 30

euros per ton, which was a sufficient price to influence companies' investment decisions to take into account the lower emissions targets. In the United Kingdom, the Carbon Price Floor (CPF) was introduced in 2013 to support the EU-ETS by taxing fossil fuels used to generate electricity via Carbon Price Support rates set under the Climate Change Levy. Since the implementation of the CPF, there has been significant reduction in coal electricity generation, which has partly been attributed to the CPF (Hirst 2018).

Besides the reduction of emissions, one major challenge is the adaptation, especially in the developing countries that neither have the infrastructure nor the resources to alleviate the effects of climate change. According to the latest finance flow data, only USD 22 billion was directed toward adaptation, wherein the estimated amount needed to alleviate climate change is between USD 280 billion and USD 500 billion in the year 2050 (UNEP 2016). Consequently, in order to prevent loss of biodiversity and worsening of living conditions, over tenfold increase in adaptation flows is needed. According to Hallmeyer and Tonkonogy (2018), there are several barriers that explain the lack of financing when it comes to adaptation, both in private and public sectors, especially in developing countries. Their barrier framework identifies three distinct categories: context, business model, and internal capacity barriers. In an adaptation finance scheme, context barriers refer to gaps in regulatory stability, enforceable laws, and the protection of property rights, especially in developing countries where adaptation finance is most needed. Business model barriers are specific, to the context of the product or service being offered, and refer to uncertainty of investment returns, high up-front costs, and lack of technical capacity to implement and maintain adaptation products. Internal capacity barriers refer to the scalability of adaptation services and products.

Summary

Although climate financing flows are increasing, hundreds of billions of dollars or more

will still need to be mobilized to achieve transition to a low-carbon-resilient economy. If this is to be accomplished, multiple different measures need to be implemented, especially to activate investments of the private sector into emerging economies. One of these measures is to make the data more accessible to the decision-makers by quantifying and representing complex issues with key metrics, such as with MAC curves or other analysis tools, so that each choice between activities becomes comparable in terms of cost and climate change abatement. Second, there should be compelling incentives for each stakeholder to make carbon-emission-reducing investments and decisions based upon those key metrics.

Definition

Modern societies have to work hand in hand with public powers to ensure that all social groups, including the most disadvantaged, can develop their projects. In this sense, many civic-social initiatives have proliferated over the last few decades, but none other is comparable to the

Clinton Global Initiative: it seeks to perpetuate the achievements of a presidential administration characterized through a discourse based on the dialogue and the concord, moving, at last, from empty words to tangible deeds.

Introduction

The last years of the twentieth century brought a myriad of geopolitical events such as the Fall of the Berlin Wall (1989), the environmental disasters of Bhopal (1984), Chernobyl (1986) or Exxon Valdez (1989), the meteoric growth of the Chinese economy in the aftermath of Deng Xiaoping's principles ("One country, two systems") that signaled the advent of a New International Economic Order (NIEO).

In this context, the world economic concert resulting from the Second World War became totally obsolete, with which many voices began to emerge that proposed a new economy less dependent on fossil fuels as well as a way of doing politics centered in "common people" that was close to the concrete needs of citizens and that could not be pigeonholed within the left- or right-wing of the ideological spectrum. Among these dissonant voices, two young American dreamers soon stood out: Bill (William Jefferson) Clinton and Al (Albert Arnold) Gore who would eventually become, respectively, President and Vice President of the United States (1993–2001). Fortunately, the end of this period would by no means mean a definitive halt in the ambitious renovation project of Clinton and Gore, but it continues to be present through the philanthropic programs of their foundations and, very especially, through the renowned Clinton Global Initiative Clinton Global Initiative (McGurn 2012).

This entry analyzes the meaning of this institution in contemporary society, contextualizing it within the scope of the main objectives of the Clinton administrations since, in a certain sense, it can be considered a natural evolution of Bill Clinton's first presidency summarized in the *motto* "Putting People First" that popularized it. These innovative policies were later materialized in the Clinton Foundation, on which the

Clinton Global Initiative depends, also named under the watchword "Turning ideas into action." According to this initial layout, the main characteristic elements of the Clinton Global Initiative are detailed below.

Putting People First

After the collapse of the Soviet Union and its bloc of influence, American society began to reconsider the almost obligatory need for a drastic reduction of disproportionate military spending, allocating public resources to policies of a pronounced social character. It was a new way of doing politics, "Putting People First," of a pragmatic rather than ideological orientation, completely exempt from the bureaucracy that kept away the average American citizen from her/his representatives, reinvigorating the entrepreneurial spirit that had always defined the American people. Clinton and Gore (1992) pointed out that those policies were neither liberal nor conservative, neither Democratic nor Republican. They were simply "new and different."

The awareness of the environmental issues undoubtedly conditioned these new ways of doing and understanding politics from social action. In fact, in 2007 A. Gore received the Nobel Peace Prize for his courageous efforts to denounce to the world public opinion the environmental change that was the result of the hand of man and that, in any case, could always be avoided if effective measures were taken in time, capable of counteracting the irreversible effects of the global warming (Gore 1992). At these times, an ecological catastrophe systematically concealed by the Soviet *nomenklatura* to the rest of the world began to be known, which powerfully drew the attention of A. Gore: The gradual drying up of the Aral Sea, which the American politician can observe in situ (Zonn et al. 2009). This environmental disaster was due to the unconscious overexploitation of water resources and the detour of the course of two great rivers of Central Asia: the Syr Darya and the Amu Darya. The apocalyptic image of the merchant ships stranded in the middle of the desert contributed to the

“Putting People First” program to take an even greater stand for environmental awareness in the United States, doing everything possible to ensure that such events would not be repeated in this nation or the rest of the world, thus ending the old short-sighted policies of “something for nothing” whose result had not exactly been positive for society during the Pre-Clinton era (Clinton and Gore 1992).

The Clinton Administrations always had a global projection, trying to extend the ideals of democracy and social justice to other areas of the planet. In this sense, it is necessary to emphasize the efforts of Clinton for the adhesion of the People’s Republic of China to the GATT (General Agreement on Tariffs and Trade) in 2001, with a threefold purpose: to generate substantial economic benefits in the US economy, to create a gradual opening of Chinese society and to develop synergies between all world economies, finally free of trade barriers. On the other hand, the democratization of the countries from the former socialist bloc was another of its keys to break the political-social isolation of this area (MacLean 2006), passing from the militarist policy of most of its predecessors in the oval office to another merely based on the dialogue.

Within this frame of reference, human capital prevails over economic capital, which is why

investment in the future of the youngest was promoted as a priority, training them in various technical disciplines such as basic sciences, mathematics, and engineering (Rumyantseva 2017). After his presidential mandate, Bill Clinton applied this humanistic perspective to the conceptualization of the Clinton Foundation in 2001, leaving a statement of his intention to perpetuate the social policies exercised by his administrations during the period 1993–2001. This foundation has its origins in the American philanthropic movement initiated by A. Carnegie in the early twentieth century, which has borne fruit in a wide range of charitable organizations and initiatives of a similar nature around the world, such as (just to name a few): The Aga Khan Foundation, The Azim Premji Foundation, The Bill & Melinda Gates Foundation, The Howard Hughes Medical Institute, The International Buddhism Foundation, The Novo Nordisk Foundation, The Stichting INGKA Foundation, The Wellcome Trust, etc. Its objectives are synthesized from the phrase “empowering people to build better futures for themselves, their families, and their communities” (see Clinton 2016) and are distributed in three major areas of direct action: Economic, Health-Welfare, and Civic Service, according to the scheme shown in Fig. 1:

Clinton Global Initiative, Fig. 1 Main goals of the Clinton Foundation. (Source: Own elaboration from Clinton Foundation (2020a))

Turning Ideas into Action

The pragmatism that characterized Clinton's policies is the main defining element of the Clinton Global Initiative once it begins operations in 2005. It constitutes a dependent entity of the Clinton Foundation of which it could be considered its flagship but, unlike the Clinton Foundation, it does not finance or develop projects or involve any kind of direct disbursement to the organization (Gaouette 2016), except for the donations that cover its general expenses. This entity simply puts donors in contact with groups that have specific needs in order to solve their problems, thus creating an extensive network of global cooperation.

This pooling of donors vs. "needs of common people" takes place in the form of periodic events throughout each year, including a major annual event that takes place every September in New York. Since the Clinton Global Initiative aims to move from words to action, these cooperation projects are generically referred to as "commitments to action" (Clinton Foundation 2020b). Among the cooperation projects, those that take into account the effects of global warming (Tillett 2006), the full integration of the female collective in the field of scientific research (Ranani and Kharazmi 2017), and, above all, the integral development of the world's youth should be pointed out. A large number of projects led by the Clinton Global Initiative are usually recorded in a database (see, e.g., Sund 2011). It should be noted that only in the period 2005–2016, the members of the global network formed for this organization have conducted more than 3600 projects in 180 countries, contributing to the improvement of the living conditions of 435 million people. As an illustration, Table 1 summarizes 26 commitments in effect in November 2020:

Summary

The enduring legacy of the Clintonian administrations was a breath of fresh air in which a transition was made from "macropolitics" to "micropolitics" by addressing the needs of the

ordinary citizen as opposed to any other previous consideration. The social component, as well as the environmental concerns, has played a leading role thanks to this new way of doing politics, creating a new framework of understanding between public opinion and the decisions taken by the politicians, who are now more open to listening to the requests of the citizens than to unilaterally take decisions of no relevance to the future of society, especially to the future of its youngest members. On these principles, the Clinton Foundation was built, being the Clinton Global Initiative the instrument that this institution uses for political activity is not only expressed in simple words but in social commitments that can and should be carried out. Obviously, like any other innovative institution, it has also received some criticism from ideological perspectives contrary to Bill Clinton's philanthropic tasks, by accusing it of lack of transparency in the accounts that could raise certain suspicions that its donors can buy political influences instead of doing purely charitable practices. Criticism, or at least doubts, has also come from Bill Clinton's own party: in fact, Bernie Sanders made public his disagreement with donations coming from foreign governments, especially if they were undemocratic (see, e.g., Gaouette 2016).

It is noteworthy that Bernie Sanders' controversial opinions tend to have special significance both within the Democratic Party and in the public opinion as a whole: since his beginnings as a young activist in support of civil rights (when he was affiliated with the Socialist Party of America), he always maintained a contentious attitude towards the political elites of Washington D.C. During his lengthy political career (Mayor of Burlington, Vermont (1981–1989), U.S. House of Representatives (1991–2007), and U.S. Senate (2007–present)), the essence of his ideology was based on the total transparency of public accounts in the eyes of the citizens, on the basis that, according to his position, electoral campaigns should be financed in the form of crowdfunding or "small-dollar donations" in order to avoid the interference of third countries in political

The Club of Rome

Definition/Description

In its words, the Club of Rome defines itself as “an organization of individuals who share a common concern for the future of humanity and strive to make a difference.” Its members are notable scientists, economists, businessmen and businesswomen, high level civil servants and former heads of state from around the world. Their mission is to promote understanding of the global challenges facing humanity and to propose solutions through scientific analysis, communication, and advocacy. Their distinct perspective is holistic, systemic, and long-term.

The Club has published a number of peer-reviewed “Reports to the Club of Rome,” the most famous of which is “The Limits to Growth” (1972). In September 2019, following the UN Climate Action they launched the “Planetary Emergency Plan - Searching a New Deal for People, Nature and Climate”, while in June, 2020 they issued “Bildung - Keep Growing”, a document that encourages to rethink the approach to “knowledge exchange, education and life-long learning as anchors for holistic economic and

political development at the community, national and global levels”.

The History

The history of the Club of Rome began in 1967 with a fortuitous crossing of paths between Aurelio Peccei, a successful Italian manager, economist, and man of vision, and Alexander King, an eminent Scottish scientist, scientific director of the Organization for Economic Cooperation and Development.

In a keynote speech, Peccei expressed his concerns about socio-economic development, environmental degradation and the North/South divide. A series of coincidences resulted in Peccei's speech transcript landing on the desk of Alexander King, who was so impressed that he contacted Peccei and suggested a meeting.

In April 1968, a group of 30 people, including scientists, economists, educators, humanists, industrialists, and national and international civil servants, from 10 different countries, met at the Accademia dei Lincei in Rome. The aim was to discuss “a subject of staggering scope – the present and future predicament of man” (from the foreword of Meadows et al. 1972). But the meeting was a flop mainly as the document they were asked to discuss was too abstract, complicated, and controversial. The participants recognized they had been “too foolish, naïve, and impatient” and decided to spend the following year(s) educating themselves: they call this discussion circle the “Club of Rome.”

Until 1969, the Club remained an informal group of individuals who met for a better understanding of global problems. Although the membership was (and still is) limited, the number of participants progressively expanded to include representatives of an even greater variety of cultures, nationalities and value systems. Owing to this increase, it became necessary to create a legal structure and to appoint a President: Aurelio Peccei was the first President of the Club of Rome.

All the members were united by the conviction that the major problems facing mankind were of such complexity and so interrelated that

traditional institutions and policies were no longer able to cope with them, nor even to understand their full implications (foreword of Meadows et al. 1972). In particular, Peccei strongly believed that understanding the “*problematique*,” as they called the interconnected challenges, was essential for the future. A series of meetings of the Club culminated with the decision to start the ambitious “Project on the Predicament of Mankind” (The Club of Rome 1970).

By invitation of the Swiss Government, on June 1970 the Club held its first official meeting in Bern.

During this meeting, Jay Forrester, a professor of the Massachusetts Institute of Technology (MIT), suggested building a computer model that simulated the interactions between the main factors considered to be the basis of humanity's problems.

In less than a month, Forrester presented a draft model which showed how, in a world of finite dimensions, the continuous growth of variables such as pollution and population would, sooner or later, lead to collapse. Convinced by these preliminary results, the members of the Club of Rome insisted on refining the study.

Forrester involved one of his colleagues, Dennis Meadows, who became the scientific director of the group. Meadows gathered a team of young researchers, to develop a model with five variables: population growth, food production, industrialization, pollution, and consumption of nonrenewable resources. The result was the first Report of the Club of Rome. “*The Limits to Growth*” was the first study to question the viability of continued growth of the human ecological footprint. The book was a success!

In just a short while, the Report and the Club of Rome found themselves at the center of a world controversy. However, this sudden fame attracted the attention of the public and the support of important political figures such as Maurice Frederick Strong – president of the first UN climate conference, held in Stockholm in 1972 – and Sicco Leendert Mansholt, then President of the EEC. The Club of Rome had achieved one of its goals: to raise international attention to sustainability issues.

In 1974, Peccei was able to hold a meeting in Salzburg between members of the Club and some heads of state. The event ended with a press conference attended by 300 journalists and the publication of the “Salzburg Statement.” This statement emphasized that the 1970s oil crisis was part of a global problem and not simply a political issue, as many then believed.

Following the death of Aurelio Peccei in 1984, the Club underwent important changes. Alexander King was appointed President, the post of Secretary General was created, and the headquarters were moved from Rome to Paris, where King was based. The Club also made a deliberate change to its approach to “the predicament of mankind.” While maintaining a distinctively global approach, it chose to focus on particular aspects of the challenge, such as governance, peace and disarmament, population growth, and the consequences of advances in science and technology. This new approach persists even now.

Subsequent Presidents represented different cultures, positions in society, and value systems. In 1990, Ricardo Diez-Hochleitner, a Spanish diplomat, educational reformist and economist, was appointed President. He had held key education-related posts in international organizations, including the Organization of American States, the World Bank and UNESCO. While in 2000, during a meeting in Madrid attended by Juan Carlos, King of Spain, and Queen Sophia (both Honorary Members of The Club of Rome), HRH Prince El Hassan bin Talal of Jordan was appointed President.

A period of Co-Presidency then followed. In 2007, Ashok Khosla, a leading Indian environmentalist, and Eberhard von Koerber, a German businessman were appointed Co-Presidents. In 2012, it was the turn of Ernst Ulrich von Weizsäcker, a leading German expert in resource efficiency, and Anders Wijkman, a Swedish politician and former member of the European parliament. Finally, during the celebrations of the Club’s 50th anniversary in Rome, for the first time in its history, the members appointed two women to co-lead the organization: Dr. Mamphela Ramphela (South Africa) and Sandrine Dixon Declève (Belgium) were appointed Co-Presidents.

In the meantime, the Club moved from Paris to Hamburg (Germany) and has its headquarters in Winterthur (Switzerland) since 2008. It is now working in close cooperation with a number of private and public institutions globally, also thanks to the National Chapters.

Table 1 reports the main stages in the history of the Club.

The Mission and Vision of the Club of Rome

The Club of Rome is a global network of independent and renowned thinkers. The Club of Rome analyzes today’s challenges facing the world, the root causes and the possible features in a systematic and holistic manner.

The Club of Rome encourages global debate in order to set in motion actions that by the middle of the century will ensure a more secure, equitable and prosperous world. (text of a video available at <https://www.clubofrome.org/about-us/> – accessed on 29 August 2019–)

Even if it has continuously kept abreast of the new challenges emerging in different contexts, the vision of the Club of Rome has retained some of the features that have characterized it since its beginnings. Below the words published in the official website (accessed on 29 August 2019) on the members' vision of the Club:

Humanity faces an existential crisis. We face threats of systemic collapse on many fronts. The philosophical underpinnings of modern societies' democratic institutions and core values of respect for human rights, the rule of law and ethical use of science are all under threat. Decades of exponential growth in both population and consumption are now colliding with the limits of the Earth's biosphere destabilizing the very foundations of intelligent life as we know it today. It is encouraging to see a growing level of consciousness across the globe of the need to ask questions about how we engage in conversations to enable us to shape a new core value system that would enhance harmony between humans and with nature. The critical shift for the Club of Rome is a move beyond sounding the alarm to advancing conceptual frameworks essential for actualizing humanity's potential as a beneficial rather than solely predatory species.

This vision recurs throughout the various documents published by the Club over the years.

National Associations

The Club of Rome has supporters in many countries who have decided to create a National Association or Chapter to promote debates and activities related to the Club of Rome in local, regional, or national contexts. At the moment, there are National Associations in more than 30 countries. They are legally separate entities.

Under the new Co-Presidency established on the 50th Anniversary of the Club in 2018, the relationship between the Club of Rome and the National Associations is under revision to make them stronger and to increase the efficacy of the

Club's overall strategy promoting the shift towards a more sustainable world.

Membership and Governance

The members of the Club are typically prominent scientists, business leaders, ex-politicians, or retired heads of state. All share a common concern for the future of humanity. Potential new members are proposed by a current member to the Executive Committee.

There are three main categories of membership: Full Members (with voting right), Associate members, and Honorary Members.

The Club of Rome is governed by an Executive Committee. The members of the Executive Committee are appointed for 3 years and are eligible for re-election. One or two Co-Presidents are elected from amongst the members of the Executive Committee.

The Club of Rome receives contributions from a wide range of international organizations, foundations, and individuals from around the world. It also receives annual subscriptions from its members.

Activities

The Club of Rome acts as a catalyst of change mainly by sponsoring studies and conferences and publishing reports. Since the beginning of its activity, the Club has been committed to identifying the most critical problems facing humanity, analyzing all the possible interrelations on the basis of an interdisciplinary, holistic, and global perspective, and finding positive scenarios based on humanity's response to these problems.

This approach has been taken since the first document issued by the Club "The Predicament of Mankind" (The Club of Rome 1970).

The Predicament of Mankind

After the first meetings of The Club of Rome in 1968, its members agreed to undertake an

ambitious project: “The Predicament of Mankind.” The intent of this project was to tackle the complexity of the problems troubling men of all nations, such as poverty, environmental degradation, loss of faith in institutions, urban spread, insecurity of employment, alienation of youth, rejection of traditional values, inflation, and other monetary and economic disruptions, in a more interconnected way (Meadows et al. 1972). As stated in the report:

When we consider the truly critical issues of our time such as environmental deterioration, poverty, endemic ill-health, urban blight, criminality, etc., we find it virtually impossible to view them as problems that exist in isolation or, as problems capable of being solved in their own terms. For even the most cursory examination will at least reveal the more obvious (though not necessarily the most important) links between problems. (The Club of Rome 1970: 12)

Despite possessing considerable knowledge and skills, mankind does not understand “the origins, significance, and interrelationships of its many components and thus is unable to devise effective responses. This failure occurs in large part because we continue to examine single items in the *problematique* without understanding that the whole is more than the sum of its parts, that change in one element means change in the others” (Meadows et al. 1972: 11).

In 1970, Professor Jay Forrester of the Massachusetts Institute of Technology (MIT) presented a global model to the Club that allowed many specific components of the *problematique* to be clearly identified and suggested a computer technique for analyzing the behavior and relationships of the most important of those components. This presentation led to the initiation of a study conducted by an international team, under the direction of Professor Dennis Meadows, with financial support from the Volkswagen Foundation. The result was the publication, 2 years later, of “The Limits to Growth.”

The Limits to Growth

It is by far the best-known report of the Club of Rome. Even after nearly 50 years from its issue, it remains a pillar of the literature on sustainability.

Translated into over 30 languages, the book has sold more than 16 million copies.

The Limits to Growth is the nontechnical report of the findings of the group of young researchers from the MIT. The study was based on multiple simulations of a “system dynamics” computer model of the five basic factors that determine and therefore, ultimately limit growth on this planet: population; agricultural production; natural resource use; industrial production; and pollution.

The results of the simulations bore witness to the idea of physical limits to continuous growth, involving resource depletion and pollution.

The message of the book still holds true today: “The earth’s interlocking resources – the global system of nature in which we all live – probably cannot support present rates of economic and population growth much beyond the year 2100, if that long, even with advanced technology” (Meadows et al. 1972: back cover).

Rather than a dramatic prediction of future doom, the report maintains that men and women can change the world and establish a sustainable condition of economic and population stability and a fair and equitable global distribution of resources:

Man can create a society in which he can live indefinitely on earth if he imposes limits on himself and his production of material goods to achieve a state of global equilibrium with population and production in carefully selected balance. (Meadows et al. 1972: back cover)

After the Limits to Growth, the Club of Rome has identified a number of global issues facing humanity and issued a series of important reports on different topics, such as depletion and pollution of the environment, demographic problems, the quality and distribution of work, the sociocultural impact of new technologies, dysfunctional governments and educational systems, financial disorder, etc.

After the celebration of its 50th Anniversary, held in Rome (2018), the Club embraced four main themes:

- Emerging New Civilization(s) Initiative
- Reclaiming and Reframing Economics
- Rethinking Finance
- Climate Emergency

The latter is part of a project launched on December fourth 2018 at the European Parliament: *The Club of Rome – Climate Emergency Plan*.

Codes of Conduct in Greece

Ioannis Φ. Panagiotopoulos
Department of Business Administration,
University of the Aegean, Chios, Greece

Synonyms

[Business codes](#); [Codes of ethics](#); [Ethical codes](#); [Responsive business conduct](#)

Introduction

Corporations have obtained tremendous power in modern world that sometimes is even bigger than governments. So, the spotlight is turned to them examining their intentions to use their power and influence either for good or bad purposes. Thus, the concept of business ethics has special value in business world of the twenty-first century. The parameter of ethos, with its ancient Greek meaning or ethics in modern English, refers to a moral character that can distinguish good and bad, right and wrong, and continues doing the right, good, ethical thing (Eisenstein 2020). A lot of firms have created a so-called code of conduct which is considered as a guide for ethical behavior. This affects the processes inside the organization and furthermore the interaction of the organization with its external environment and its stakeholders including the society and the state. Greece entered in the eurozone in January 2001, and this signals a new start for the country whose companies try to compete in the European and global financial environment, and, thus, they endeavor to apply the idea of code of conduct in their everyday business activities (Skouloudis et al. 2011).

Definition

A code of conduct is an effort to institutionalize the principles and the ideals of the corporation's founders in a way that every new employee has the chance to study them and become part of corporate culture (Weiss 1994). Ethical codes consist of an effort to improve a firm's atmosphere so that employees could behave ethically (Shaw and Barry 2016). The legal system is not so tight to force corporations to take into account all the ethical aspects of their actions (Arrow 1973; Cohen and Stone 1976).

Ethics can be defined as a systematic attempt to make a cohesive, rational whole out of our individual and social moral experiences. The purpose of this attempt is to formulate rules to differentiate good and bad human conduct (De George 1992). In terms more specific to business, ethics provide the foundation for employee pride and motivation

(Hall 1992) and provide a condition for customers' satisfaction (Hall 1992). Ethics and quality can be equated insofar as the production of quality goods and services is *prima facie* ethical treatment of the consumer.

Historic Review

American corporations were the first which adopted codes of conduct, and the European companies of the biggest European countries followed their example. A big development in the adoption of codes of ethics was recorded during the 1970s and 1980s because of business scandals. The owners of the companies had to enhance their integrity, and the existence of codes of conduct could operate as a symbol to both internal and external stakeholders (Murphy 1995). Nowadays, the existence of code of conduct is spread all over the world. However, the proportion is not the same among the countries (Langlois and Schlegelmilch 1990; Skouloudis et al. 2011). The corporations in the countries of Southeast Europe like Greece, Italy, Portugal, and Spain have developed code of conduct later than those in Northwest Europe (UK, France, Germany, Netherlands) (Albareda et al. 2007). Indicatively, Langlois and Schlegelmilch (1990) had recognized that European companies in total were almost 10 years late than American companies since the proportion of the first with codes was 41% and the second was 75% in the mid of 1980s.

Langlois and Schlegelmilch (1990) identified three kinds of codes in use in Europe and the USA: (1) regulatory documents giving specific advice on behavior and conduct; (b) short, broad creeds including statements of aims or values; and (3) elaborate codes covering social responsibility to a set of stakeholders and many other topics. Regardless of the type chosen, generally good codes of conduct have certain characteristics. Codes should be accurate so that the behavior is expected or denied is easily understood. Codes should also be comprehensive so that reference to the code will aid in effecting the solution. Additionally, enforcement is essential in the long-term efficacy of the code. For most effective use of the code, it

should be publicized: If employees do not know of the existence of the code or that it might be helpful in solving a problem, the employee will not make use of it. Finally, codes should be continually revised to keep up with changes in law, politics, demographics, and technology (Payne and Dimanche 1996).

Literature Review

A host of ethical issues surrounds business. Research of ethical dilemmas faced by domestic US businesses has been conducted in areas of economic justice, marketing, corporate codes, corporate morality, and whistleblowing, just to name a few. The need for ethics in business is recognized by both consumers and businesses alike. Laczniak and Murphy (1991) reported several statistics that make such concern obvious: The majority of Americans believe that most businesspeople regularly participate in ethical transgressions, and 76% of the American public feel that a lack of business ethics in business managers contributed to the decline of US moral standards. French, German, and American managers have overly agreed that sound ethical practices are good business in the long run (McDonald and Zepp 1989).

Ethics in business is not an option – it is not only necessary but an absolute requirement for success. These remarks underline the importance of taking a long-term view of financial success and of the necessity of strong leadership and focus to develop a positive corporate culture (Pitts and Cooke 1991).

Attribution theory suggests that the root of an unethical behavior is the person himself and not the organization's environment. This view of seeing people as causal agents rather than facing environmental influences for ethical or unethical behavior could make code of conduct look meaningless (Messick and Bazerman 2001). However, a synthetic view where an unethical behavior could be a combination of person's character and environment's characteristics implies that a code of conduct has the power to send messages and influence toward the good direction. For those

with ethical personality, a code of conduct operates as a supportive tool for ethical behavior. For those who are looking for chances to act unethical, a code of ethics operates as a deterrent. Finally, for those who are in between, a code of ethics serves as a guide about the expected behavior in difficult situations. The fear of punishment or the expectation of a reward serves as motives for employees in companies with code of conduct. In general, the existence of a code of ethics sends the message that the company places some value on ethical attitude in company's functioning, and there may be consequences positive or negative based on an employee's behavior under certain conditions. The total absence of a code of ethics could be interpreted as lack of interest for any moral aspect in doing business by top management (Adams et al. 2001: 201).

Top management uses codes of conduct to send messages about its expectations of standards that go beyond behavior required by law. Thus, a code of conduct is a cornerstone for company's culture (Stevens 1994). However, it is at least of equal importance the level of respect to that code which has influence on employees' behavior and corporation's culture. Although there is a prestige around such a code especially in big companies, there are a lot of opinions regarding the effectiveness of these codes on perceptions and attitude of employees (Treviño and Nelson 2017) or even of employees' understanding and recall of specific messages of that code in a decision-making process (Weaver 1995).

The mere existence of a code of ethics is at first a good thing assuming that employees receive an initial message that ethics matter. However, this cannot serve as an assurance that top management has a great understanding of the kinds of difficulties that employees strive. Nevertheless, there could be negative consequences from the existence of a code of conduct. Some employees may feel that they can just follow the instruction of such a code and avoid understanding the complexity of a situation and find the best solution. A code of conduct may enhance a diffusion of responsibility among several people and lead to a lack of initiatives since an employee could feel safe behind words (Toffler 1991). In

this case, a gap between words and deeds may convert a code of conduct to a guide of inertia where avoiding responsibilities and risk of punishment is the best solution. However, Weber (1990) suggests that when an organization has no code of ethics, employees may behave less ethically inside the organization than what they usually do out of the office based on what their personality indicates because their personal beliefs could be overcome by company's culture.

A code of ethics enhances corporate ethical behavior by creating dialogue among employees about moral topics. In this case, a code of ethics along with a specific issue that may arise causes an exchange of ideas among colleagues hopefully prior of decision-making (Fisher 1993). Waters (1988) asserts that such discussion internally challenges top management to express its opinion and guidance. Carroll (1991) states that a formal code of conduct serves as a key symbol that senior management cares about ethical behavior. Adams et al. (2001: 208) support that the majority of employees in companies with an official code of conduct cannot recall any specific content of it, but they pay attention to its existence. Their findings indicate a different perception about business ethics between employees of companies having a code and employees of companies lacking a code.

It is true that employees of firms with an official code of conduct tend to behave more ethically rather than those in companies without an ethical code because they do not feel discouraged to do so. The code of conduct is also a manifestation from top management to employees and stakeholders about their principles and values (Adams et al. 2001: 208). It is noteworthy to be mentioned that Adams et al. found that the biggest differences in perceptions concerning business ethics were detected in senior management body of respondents from firms with ethical code versus those without an ethical code. The most important is the existence or not of an ethical code rather its content itself.

Greek Framework

The upgrading of the Greek capital market to mature market status, the entrance to eurozone in

2001, and the global competition for capital have boosted the corporate governance (CG) idea in Greece. The collapse of Greek stock market after 1999 created a lack of trust in investors from Greek companies. The Olympic Games of 2004 put the Greek market in the international spotlight, and the interest in investments in Greece was increased. The Greek economy sustained a high growth rate up to 2007 (Spanos 2005). The global crisis of 2007–2009 had as consequence a big recession period in Greece between 2009–2019 which is continued due to the pandemic of Covid-19.

Some of the major characteristics of the Greek market are as follows:

- (a) The high level of individualism of the Greeks.
- (b) The relations of interdependence among politicians, media groups, and economic interests.
- (c) The phenomenon of avoidance of tax payment. Aggressive tax avoidance in terms of transfer-pricing practices and formation of offshore companies has flourished in recent years, and the present tax reforms have taken into account such methods of tax avoidance. However, there is a plethora of opportunities for tax avoidance due to the existence of loopholes in the Greek tax system to take advantage of. This consists of the ultimate dilemma for any organization that claims a socially responsible operation and assures its stakeholders to be a good corporate citizen (Skouloudis et al. 2011).
- (d) Furthermore, Greek economic environment includes less large-sized firms and more small- and medium-sized enterprises (SMEs).
- (e) Traditionally, Greek companies were – and most of them remain – family owned. Family members are the owners, the board members, and company's executives. This kind of structure does not facilitate the development of ideas like CG and code of ethics since the owners feel that they keep the control of the organization and there is no need for these tools (Skouloudis et al. 2011). Thus, a global principle that applies in the Greek case is that smaller organizational size is associated

with less formalization in organizational procedures, including the adoption of a formal ethical code.

The discussion of CG in Greece is focused mainly on protecting individual and minority shareholders' interests that are practically cut off from the decision-making process of the firm. CG was first introduced in Greece in 1998 through an introductory paper published by the Athens Stock Exchange (ASE). A series of conferences and discussions led, then, to the adoption of a voluntary code of conduct in 1999 initiated by the Hellenic Capital Market Commission (HCMC) in collaboration with all relevant agents in the Greek economy. In May 2002, the Ministry of the Economy amended the corporate law and incorporated fundamental CG obligations. Moreover, the National and Kapodistrian University of Athens has established a rating system for the listed companies in Greece based solely on CG criteria. The legislative framework of the Greek capital market is now fully harmonized with the guidelines and directives of the EU. Although improvements in CG have occurred in Greece, they are mainly confined to a small number of large, listed companies that are more in tune with the international corporate stage (Spanos 2005).

The main drivers for the adoption of code of conduct in Greece were (a) the example of multinational firms with branches in Greece and the ambition of their Greek competitors to obtain similar structure and performance, (b) the trend of private family-owned companies to be transformed to public listed companies because of their need for raising capital in the late 1990s, and (c) the unexpected capital market growth in the country in 1997–1999 and the following underperformance the next years 2000–2002. The efforts to restore investors' confidence and people's trust in the stock market included extensive discussions by specialists, scientists, businessmen, auditors, legal practitioners, etc., about a more transparent system of CG which should include a code of conduct among others.

A voluntary code of conduct with the title "Principles on Corporate Governance: Recommendations for Its Competitive Transformation"

was created by the ad hoc Committee on Corporate Governance 1999 which was in compliance with the Principles of Corporate Governance of the Organisation for Economic Co-operation and Development (OECD). There were 44 recommendations compiled on seven main categories:

1. The rights and obligations of shareholders
2. The equitable treatment of shareholders
3. The role of stakeholders in CG
4. Transparency and disclosure of information and auditing
5. The board of directors
6. The nonexecutive members of the board of directors
7. Executive management

The principles and best practice rules were closely modeled according to the OECD Principles of Corporate Governance (OECD 1999; Spanos 2005).

The Federation of Greek Industries (FGI) adopted the Principles of Corporate Governance for all companies, particularly for those listed on the ASE. However, the field of stakeholders' rights was excluded (Skouloudis et al. 2011).

In May 2002, the Greek Ministry of the Economy in its effort to improve a corporate law (No. 3016/2002) added a subset of the principles that were contained in the previous voluntary code. This effort met strong opposition by industrial federations. FGI had suggested that the codes on internal governance should remain voluntarily and the regulator should refrain from legal enforcement (Florou and Galarniotis 2007).

The effort to reform corporate governance has only recently grown in Greece, where legislators and business people are struggling to reform a corporate culture that has been highly centralized around government affairs since the inception of the modern Greek state. (Mertzanis 2001)

The code of ethics is an internal policy instrument to help employees in ethical decision-making. The introduction of code of ethics developed by multinationals and other foreign companies established in Greece has overall upgraded the use of ethical policy instruments. Finally, the existing corporate culture is the

most crucial factor in affecting ethical behavior. Additionally, the top management's actions affect decision-making where there is an ambiguity or a dilemma with ethical dimensions (Siomkos et al. 2006).

At a national level, a cornerstone in the dissemination of code of conduct was the establishment of the Hellenic CSR network which belongs to the European CSR network. It was formed in Athens in June 2000 as a nonprofit organization by 13 companies and three business institutions. Its mission is to spread the ideas of sustainability in the Greek business world and the Greek society, including the development of the idea of code of conduct for corporations (CSR Hellas 2021).

Florou and Galarniotis (2007) examined the Greek companies listed in ASE regarding their CG mechanisms in place. They have identified three levels: the minimum requirements under Greek regulation correspond to the lower level; the incremental recommendations of the Greek code are categorized as the middle level; and the additional international best practices, prescribed by the UK Combined Code, indicate the higher level of CG. The findings portrayed that governance ratings of Greek companies increase with company size. Of the 274 companies out of 340 listed in ASE in 2003, 65.5% scored positively in relation to the minimum governance requirements of the national law (Florou and Galarniotis 2007). The last development is the establishment of the environmental, social, and governance (ESG) index in the ASE on August 2, 2021, which monitors 35 companies which are Coca-Cola, OTE, Alpha Bank, Eurobank, OPAP, Mytilineos, National Bank, PPC, Jumbo, Piraeus Bank, Titan, Motor Oil, GEK Terna, Terna Energy, Lamda Development, Hellenic Petroleum, EYDAP, Ellaktor, ADMIE, Sarantis, Viohalco, Fourlis, Hellenic Exchanges, Quest, Thrace Plastics, Crete Plastics, Aegean, ElvalHalcor, Piraeus Port Authority, Cenergy, European Reliance, Athens Medical, Plaisio, Alumil, and Inform Lycos. It is expected that the number of companies will reach 60 up to 2025 (ESG Reporting Guide 2019 2019).

Conclusions

Codes of conduct have not been widespread in Greek business world, and the level of uptake and diffusion differs from company to company. The slow rhythm of adoption of CSR initiatives by Greek firms of all sizes may reveal that "...Greek firms may not yet be convinced by the merits of corporate governance; instead, governance may still be viewed as an unavoidable cost" (Florou and Galarniotis 2007: 992). Especially SMEs have not proceeded with the adoption of codes of conduct (Florou and Galarniotis 2007: 992). It seems that the orientation of codes of conduct in Greek firms is to internal operations rather to external relations with their stakeholders (Skouloudis et al. 2011).

In general, the CSR concept and the idea of a code of conduct as a subset of it have a lot of space for further improvement in Greece. Only a few large firms have articulated a sound strategy for CSR and have embedded a code of conduct in it. A domestic firm's CSR agenda usually pertains to the responsibilities of the public relations, communications, or marketing departments and is mostly narrowed to charitable contribution or community donations. On the other hand, however, the recent establishment of leading sustainability indices in Greece (Accountability Rating, BITC CR index, Athex-ESG) suggests that CSR will make further headway in domestic business conduct and potentially lead to the introduction of socially responsible investment (SRI) funds in the domestic capital market in the long term (Skouloudis et al. 2011). However, there is a clear message that corporates should balance their intention for maximization of profit versus the interests of their stakeholders and take into consideration the global concerns for climate change and sustainable development.

Codes of Good Governance

Rebeca García-Ramos and Belén Díaz Díaz
Department of Business Administration,
University of Cantabria, Santander, Spain

Synonyms

Best practices recommendations; Code of Best Practices for Corporate Governance; Guidelines for good corporate governance; Principles of good corporate governance

Definition

Codes of good governance are sets of recommendations and principles about the appropriate structure of the governing bodies of organizations and the proper behavior of the members of those governing bodies (Aguilera and Cuervo-Cazurra 2004; Cuomo et al. 2016). Their purpose is to recover the confidence of shareholders and investors in the transparency and efficiency of financial markets and in the governance systems of companies (Aguilera et al. 2016; Berglöf and Claessens 2006; Hermes et al. 2006).

Introduction

Over the past decades, the concern to find optimal models of corporate governance has resulted in the publication, both at a national level individually by each country and at an international level through various international bodies, of several codes of good governance.

Although codes of good governance have their origin in the United States at the end of the decade of the 1970s, their great development took

place from the Cadbury Report, published in the United Kingdom in 1992. Since the global financial crisis of 2007–2008, “the number of corporate governance codes has increased exponentially over time” (Cuomo et al. 2016, p. 222). The European Corporate Governance Institute (ECGI) provides a code database (<http://www.ecgi.org/codes/>), which is a comprehensive source of governance codes, principles, and recommendations in Europe and elsewhere (Adams 2017). Nowadays, there are codes of good governance in more than 100 countries (Adams 2017), with several updates over time in the most developed ones (e.g., the United Kingdom is the most active country with 13 updates of its good governance code) (Andrés and Santamaría 2018).

Codes of good governance are different from other forms of regulation in that they are not formally binding and mandatory (Haxhi and Aguilera 2012, p. 239). They are soft law or soft regulation, instead of hard law or hard regulations, such as the Sarbanes-Oxley Act of 2002. They are flexible in their application and have an evolutionary character (Haxhi and Aguilera 2012, p. 239). The voluntary and self-regulatory nature of the codes, as a regulatory characteristic in the field of corporate governance, is revealed through the mechanism for implementing these codes, which is usually based on the comply or explain principle (Haxhi and Aguilera 2012, p. 239), following the trend started in the United Kingdom with the Cadbury Code (1992) (Aguilera and Cuervo-Cazurra 2009; Reddy 2019). This principle implies that companies can comply with the recommendations or explain why they have not done so (Aguilera and Cuervo-Cazurra 2009; Aguilera et al. 2016). In such a way, companies are not required to adopt all the recommendations, but are only obliged to declare to what extent they have followed the principles of good governance and, in the case of not complying with them, explaining the reasons why they have not done so.

Therefore, in most legal systems, codes of good governance have no specific legal basis, and they are not legally binding (Wymeersch 2006; in Zattoni and Cuomo 2008). Only in a minority of countries, such as Germany, the

United Kingdom, or the Netherlands in the European context, the law explicitly recognizes legal consequences of the codes or their provisions (Zattoni and Cuomo 2008). Under this philosophy of comply or explain underlies the idea that there is no optimal governance structure that suits all companies – in Anglo-Saxon terminology “one size does not fit all.” In this vein, the objective is to allow companies some flexibility, that is, they can decide what structure of corporate governance to adopt for the best achievement of their objectives, while guaranteeing greater market transparency (Cuomo et al. 2016).

The degree of disclosure of compliance with the recommendations of the national codes differs among countries (Cuomo et al. 2016, p. 223): Disclosure of the adoption of the recommendation or explanation of non-adoption may be mandatory (i.e., voluntary adoption and mandatory disclosure) or voluntary (i.e., voluntary adoption and voluntary disclosure). Mandatory disclosure may be required by securities market regulators (such as in Australia, Canada, Estonia, Luxembourg, Malta, Malaysia, Russia, Singapore, and the United Kingdom) or by law (this is the case of several countries in the European Union (EU), such as Belgium, France, Germany, Italy, the Netherlands, and Spain, given that “from 2006, EU Directives state that companies listed on an EU listed market must publish a separate corporate governance statement in their annual report in order to mandatorily disclose their level of voluntary adoption of a legally non-binding code or to explain the reasons for non-compliance with it”) (Cuomo et al. 2016, p. 223).

Key Issues

The type of issuer of codes of good governance can be classified into six categories (Aguilera and Cuervo-Cazurra 2004, p. 421): “(1) Stock exchange, when the issuer is the stock exchange or the overseer of the stock exchange (Securities and Exchange Commission); (2) Government, when the issuer is the central or federal

government or one of its ministries; (3) Directors’ association, when the issuer is an association of directors; (4) Managers’ association, when the issuer is an association of managers; (5) Professional association, when the issuer is an association of accounting or legal professionals; and (6) Investors’ association, when the issuer is an institutional investor or an association of investors.” These authors “show that the type of institutional pressure to adopt the recommendations provided by codes varies with the type of issuer: it is a coercive pressure when codes are issued by the stock exchange or investors, a mimetic pressure when codes are issued by a managers’ association, and a normative pressure when they are issued by the remaining types of issuers” (Cuomo et al. 2016, p. 223).

The design of corporate governance codes can be developed “at three hierarchical levels: international, national and individual firm level” (Cuomo et al. 2016, p. 223). In this sense, since 1996, several transnational organizations have designed several codes with the objective of improving the corporate governance of multiple countries. Its character, therefore, is more general than that of the codes promulgated at the national level. Among the institutions that have been responsible for the development of these codes are the International Corporate Governance Network (International Corporate Governance Network), the Organization for Economic Cooperation and Development (OECD), and various European organizations. The World Bank and the International Monetary Fund have also been involved in the governance of nations at an international level, although their work has consisted in the preparation of reports on corporate practices in the area of good governance and they have not drafted codes in the strict sense.

The content of the codes of good governance has been strongly influenced by the studies and practices of corporate governance (Zattoni and Cuomo 2008; Andrés and Santamaría 2018). Its starting point is very heterogeneous depending on the legal and institutional environment of each country, and, therefore, its study cannot be done outside the cultural, political-social, and

economic context where the company operates. Codes address important aspects such as the equality of all shareholders, clear accountability on the part of directors and managers, transparency in financial and nonfinancial reports, the interests of all stakeholders, and compliance with law (Gregory and Simmelkjaer 2002; Coombes and Wong 2004).

The recommendations of codes of good governance can be grouped into three main blocks: first, recommendations about committees, the shareholding structure, and the control groups; second, recommendations on the audit process and financial information; and, third, recommendations aimed at the structure and responsibility of the board of directors. The core of the codes is found in the recommendations referring to the board of directors. For instance, about 75% of the recommendations included in the recent codes of good government published by the United States, the United Kingdom, Japan, Germany, France, Italy, and Spain focus on the board of directors (composition, responsibilities of boards, configuration in committees) (Andrés and Santamaría 2018). Following the dominant approach of agency theory (Jensen and Meckling 1976; Fama and Jensen 1983), codes of good governance encourage boards to play an active and independent role in the control of managers (Zattoni and Cuomo 2008, p. 4). In general, academics and professionals recommend to increase the number of non-executive directors and have a clear separation of powers to guarantee the independence of the board, the creation of committees (e.g., appointment, remuneration, and audit committees) composed of independent non-executive directors, and the development of board evaluation procedures. The introduction of these practices is considered a necessary factor to avoid government problems of governance and to increase the performance of the board and of the company (Zattoni and Cuomo 2008, p. 4).

The effective dedication of directors to their roles is articulated in the codes through three types of recommendations (Andrés and Santamaría 2018, p. 120): a first group of general recommendations about the need for directors to

devote sufficient time to carry out their functions; a second group of recommendations referred to the number of annual meetings of the board; and a third type of recommendations that focuses on setting limits to the number of positions that the same director can occupy in other companies. In general, the codes of good governance also address, although in a very generic way, the issue of the diversity of the board of directors (e.g., age, gender, nationality, ethnic origin), paying special attention to gender diversity.

The transnational institutions have promoted the convergence of government practices with the objective of regulating markets and protecting investors (Aguilera and Cuervo-Cazurra 2009). In this vein, European unification has contributed to the convergence in governance (Reid 2003; Hermes et al. 2006, 2007), particularly through its Communication 284 (COM-284) of 2003, which addresses how to improve corporate governance in the European Union while providing specific governance recommendations, such as the strengthening of shareholders' rights, the greater disclosure of accounting information, as well as the modernization of boards of directors. Although codes of good governance are adopted at the national level, Directive 2006/46/EC of the European Commission promotes its application by requiring listed companies to refer to a code in their corporate reports on the principle of comply or explain. In 2011, the Commission approved a Green Paper through its Communication 164 (COM-164), with the aim of assessing the effectiveness of the current governance framework of European companies, in order to ensure sustainable growth and to build a strong international financial system. At this moment, corporate governance regulations at the European level are being revised as a consequence of that Green Paper and, subsequently, of the Action Plan of December 2012, as a result of which the Commission has already issued a Directive Proposal, amending Directive 2007/36/EC to favor the long-term involvement of shareholders, and a Recommendation on the Quality of Corporate Governance Reporting (comply or explain). In 2015, the G20/OECD

Principles were issued. Recently, the OECD has published the OECD Corporate Governance Factbook (the Factbook). “This 2019 edition of the OECD Corporate Governance Factbook provides a unique source for understanding how the G20/OECD Principles of Corporate Governance (the G20/OECD Principles) are implemented around the world. By providing comparative information across 49 jurisdictions including all OECD, G20 and Financial Stability Board members, the Factbook supports informed policymaking based on up-to-date information on the variety of ways in which different countries throughout the world translate the G20/OECD Principles’ recommendations into their own legal and regulatory frameworks” (OECD 2019, p. 9).

Another important question related to codes of good governance is the legal environment in which they are created. In this vein, the classification of financial systems based on their legal origin takes on special relevance (La Porta et al. 1998). It is possible to distinguish two types of countries: those framed within Anglo-Saxon law or common law legal tradition and those framed within continental law or civil law legal tradition, which in turn can be subdivided into three major legal traditions, the French, the Scandinavian, and the German. The content of the codes of good governance depends on the legal and institutional environment of each country through the legal protection it confers to investors. Empirical evidence suggests that codes of good corporate governance arise as a response to poor legal protection, trying to alleviate their shortcomings. In a global scenario in which increasingly integrated and globalized financial markets assume greater levels of prominence, codes of good governance seek to improve corporate governance when the external discipline of markets and the legal environment are insufficient to guarantee that the management team pursue the maximization of the wealth of firm owners. In this sense, López and Pereira (2006) conclude that civil law countries, where legal protection to investors is lower than in common law countries, incorporate into their codes of good governance a greater number of specifications than common

law countries, consistent with the idea that codes arise with the aim of correcting the deficiencies of the legal and institutional environment in which companies operate. On the other hand, Aguilera and Cuervo-Cazurra (2004), after analyzing the codes of 49 countries, conclude that they are more likely to be enacted where there is weak legal protection of shareholder rights, high governance liberalization, and a high presence of foreign institutional investors. However, contrary to their expectations, they find that countries with more effective systems of governance in terms of legal protection, that is, those that follow the tradition of common law, are more likely to continue improving their governance practices and develop new ones. As the authors point out, this finding could suggest that the efforts of some countries to improve the protection of their investors’ rights and improve their corporate governance are not a static practice but rather a dynamic process in which governance recommendations are reviewed and improved, meeting new business realities. Nevertheless, and in spite of the differences indicated, corporate governance recommendations converge toward the practices of the Anglo-Saxon markets. The study of Kabach-Castro and Crespi-Cladera (2011) compares the codes of good governance of Spain, Germany, and the United Kingdom and shows their remarkable similarities, despite being framed in legal systems of a very different tradition – French civil law, German civil law, and common law, respectively. However, they point out that the main difference found is in the explanations of the “non-compliance” of the rules, based fundamentally on the ownership structures (see, e.g., Aguilera et al. (2016) to deepen on the importance of ownership structure for the development of codes of good governance). Cicon et al. (2012) conclude that the difference and changes in codes of good governance across 23 European countries are explained by the strength of the legal protection and the type of issuer (Cuomo et al. 2016). Bosáková et al. (2019), after reviewing 11 codes of good governance from 17 developing and emerging countries, conclude that, when deciding the content of corporate governance recommendations,

each country must consider its particular characteristics in terms of political, legal, economic, and sociocultural environment.

Future Directions

Recent studies show that more regulation is needed to improve corporate governance practices (Cuomo et al. 2016). The current and future trends seem to point to increasingly specific regulations, that is, the development of good governance codes considering the institutional context and specific factors of the companies to which their recommendations are addressed, such as their ownership structure, size, sector of activity, etc. (Adams 2017; Aguilera et al. 2016; Andrés and Santamaría 2018).

An issue that has sparked a great debate in the field of international corporate governance refers to whether countries should impose hard mandatory regulations, as in the United States with the Sarbanes-Oxley Act (2002) and more recently the Dodd-Frank Act (2010), or if, on the contrary, soft regulation of a voluntary nature, such as that included in the codes of good governance, is sufficiently effective to improve existing governance practices and transparency and corporate responsibility (Aguilera and Cuervo-Cazurra 2009). In this regard, empirical evidence is not conclusive. From the academic field, the effectiveness of both types of regulations varying across different contexts has been highlighted. Further research is needed in order to investigate the effectiveness of both approaches and even the adoption of a hybrid system that combines both forms of regulations.

Access economy; Access-based consumption; Gift economy; Gig economy; Peer-to-peer economy; Sharing economy; Social sharing; We-conomy

Definition

In recent years, the concept of collaborative consumption which has shifted the attitudes of individuals towards consumption received a burgeoning interest among scholars and appeared as an appealing alternate for consumers (Botsman and Rogers 2010). There exist several different terminologies that capture the diverse features of the phenomenon and can be interchangeably used for collaborative consumption in the pertinent literature such as sharing economy, gift economy, gig economy, peer-to-peer economy, social sharing, and access economy (Belk 2014; Dredge and Gyimóthy 2015). Collaborative consumption has been emerged as a new consumption paradigm, drawing a considerable attention of both consumers and entrepreneurs due to the heightened concerns over economic crisis and environmental conservation (Tussyadiah 2015). Owing to collaborative consumption, consumers get access to goods they necessitate for a limited time period rather than purchasing or owning them (Bardhi and Eckhardt 2012). In that vein, collaborative consumption can be defined as “a form of consumption where people coordinate the acquisition of a resource for a (monetary or non-monetary) compensation” (Belk 2014, p. 1597). In a parallel vein, Bardhi and Eckhardt (2012, p. 881) have defined market-mediated access-based consumption as “the transactions that may be market mediated in which no transfer of ownership

takes place.” In addition, Benkler (2004) explains collaborative consumption activities as “non-reciprocal pro-social behavior,” referring to the collaborative acts of individuals regardless of the existence of any potential reciprocal exchange in future. Similarly, Botsman (2014) defines collaborative consumption as “a system activating the untapped value of assets through models and marketplaces that enable greater efficiency and access” (p. 24).

Key Issues

Given the benefits of collaborative consumption models, individuals gain access to goods without paying higher costs and taking responsibility stemmed from the ownership (Hartl et al. 2016). In this sense, collaborative consumption offering a wide range of several sharing exchanges in a variety of business fields, transport (e.g., car sharing like Uber), accommodation (e.g., house sharing like AirBnB), entertainment (e.g., file sharing like Soulseek), and food (e.g., communal gardens like Revolv). Key underlying features of collaborative consumption platforms can be listed as: (1) *access over ownership*, referring to the getting access to the goods regardless of owning or purchasing them; (2) *peer to peer*, implying to the transactions among peers mediated by digital platforms; and (3) *distribution of ineffective resources*, meaning to the sharing owned but idle resources to the access of everyone via monetary and non-monetary transactions (Constantiou et al. 2017).

In the light of these considerations, there appears to be three main players engaged in collaborative consumption transactions: (a) *the online platform*, which serves as a intermediary that sets demand with the supply in terms of different sharing options such as renting, hiring, swapping and provides a number of complementary services for both providers and consumers such as instant messaging, reviews, and ratings; (b) *peer providers*, involving individuals or companies that intend to share or exchange the goods or services for consumers; (c) *peer consumers*, that are the beneficiaries of shared or exchanged

goods or services and engaging in collaborative consumption activities provided by P2P internet-based platforms with an aim of accessing goods/services for environmental or economic purposes (European Commission 2016; Hausemer et al. 2017; OECD 2016).

Besides, another critical issue from the perspective of consumer policy is to distinguish the collaborative consumption activities regarding the level of market mediation such as non-monetary and monetary transactions. While the former depends upon sharing systems and having access for goods/services for free (e.g., sharing systems like Couchsurfing), the latter provides access to goods/services with monetary purposes (e.g., renting systems like AirBnB) (Bardhi and Eckhardt 2012). On the other hand, collaborative consumption platforms can be also classified as sequential (i.e., exploiting from goods/services at different times) or simultaneous (i.e., exploiting from goods/services simultaneously by providers and consumers) (Scholl et al. 2015). According to the report of European Commission (2016), five key industries of collaborative consumption involves: (a) *resale of goods*, consisting of selling or purchasing used goods from other individuals such as Gumtree in the United Kingdom, Car24 in Bulgaria, Modacruz in Turkey; (b) *sharing/renting goods*, referring to the sharing or renting of goods from other individuals such as Letgo in Turkey, Trovit in the United Kingdom; (c) *sharing/renting accommodation*, comprising services for different purposes such as long-term periods (e.g., Sahibinden.com in Turkey), short-term period for vacation (e.g., Trumpam in Lithuania), specific hobbies (e.g., Campinmygarden in Greece), flat sharing (e.g., Appartager in France); (d) *sharing/hiding rides*, offering well-known examples of collaborative consumption such as car sharing (e.g., Uber, Lyft, BlaBlaCar), motorbike sharing (e.g., Relay Riders); and (e) *odd jobs*, meaning to the hiring of non-professional to do odd jobs and consisting of a wide range of services such as teaching (e.g., Cambly), dog sitting (e.g., Housemydog in Ireland), or various services such as cleaning, writing, photography (e.g., Armut in Turkey).

The Historical Evolution of the Concept

The notion of collaborative consumption was first emerged in the study of Felson and Spaeth (1978), indicating the acts of collaborative consumption including “the events in which one or more persons consume economic goods or services in the process of engaging in joint activities with one or more others” (p. 614). Nevertheless, there was no evidence of intermediaries, as it has been published 20 years before the Internet (Gyimóthy and Dredge 2017). In this regard, Botsman and Rogers (2011) have first mentioned about the mediated mechanisms for collaborative consumption models via monetizing the transactions among peers, involving broader range of activities such as bartering, sharing, lending, trading, gifting, and swapping. However, Belk (2014) contradicts with their arguments via declaring that some activities in their study do not involve monetary transactions such as “Couchsurfing” and redefines the concept as “people coordinating the acquisition and distribution of a resource for a fee or other compensation” (p. 1597). Overall, it is obvious that this term has a wide variety of meaning and there exist still various conflictions related to the conceptualization, coverage, and the meaning of the phenomenon in the pertinent literature (Gyimóthy and Dredge 2017).

Summary

The collaborative economy, as a disruptive body of innovation shifting the rules of game, has radically changed the traditional ways of consumption and received a great deal of attention from both scholars and practitioners in recent years (Walsh 2011). This entry was endeavored to explore the historical roots and definitions of collaborative consumption, putting special emphasis on its different types, key actors, and the level of market mediation via providing wide range of examples from distinct industries in which collaborative consumption activities actively engage. This new era of consumption embodies distinctive motivations, including

economic, social, ecological drivers that stimulate consumers to engage in collaborative consumption activities.

Synonyms

Collaborative consumption; Community consumption; Peer-to-peer-based sharing; Shared economy

Definition

Sharing economy is about the economy of sharing. Instead of ownership, the focus is on the (usually) temporary consumption of a good. Since several people can usually use one and the same good, the term “collaborative consumption” (Bendel, 2021; Cheng, 2016) or collaborative economy is also used. The term “peer-to-peer-based sharing” is also used, which focuses on

the interaction between provider and customer (Ludman, 2018, p.9). The sharing economy has gained a special dynamic through digitization.

Maintext

The term “sharing economy” (shared economy, collaborative economy, collaborative consumption, peer-to-peer-based sharing, community consumption) is closely related to the economy of sharing. Alternative terms are collaborative economy or consumption or community consumption is also spoken of. The concept of the sharing economy was coined by the American economist Martin Weitzman (Weitzman, 1984). In the meaning of collaborative consumption, the term was established in 2008 (Lessig, 2008, pp. 143 ff.).

The sharing economy focuses on economic activities related to the sharing of goods. These goods can be products, services, resources, or information such as knowledge. In practice, this can be, for example, cars, holiday apartments, areas, books, data, or many other goods. These are made available to consumers as the first economic “service” by suppliers. The second economic “service” is the bringing together and networking of suppliers of goods and the respective consumers. The economic advantage of the sharing economy is a better distribution of existing capacities through better organization and control of supply and demand.

When considering the economy of sharing, it should be added that the respective goods must be available. Specifically this means that products are usable and useful. One of the considerations is the basic idea of renouncing property. Think of the example of car sharing: The user of a good – for example, the driver of a car – takes it for a limited period of time, for example, for the journey from point A to point B. He takes possession of the car. At the same time, however, he waives ownership of the car, which continues to belong to the car sharing provider.

It is clear that the sharing economy is characterized by enormous heterogeneity. Not only the considered goods can be very different. The

variety of providers of the goods can be, for example, private individuals, companies, interest groups, institutions, or the state. As a so-called platform provider, a company can only aim to bring providers and buyers together by providing a (technical) infrastructure (e.g. an exchange platform) within the framework of so-called P2P platforms (peer-to-peer). Alternatively, a company can offer goods itself as a supplier (e.g. a car), conceivable ways to other companies (B2B/business-to-business), and alternatively to private individuals (B2C platforms/business-to-consumer). The heterogeneity can also be seen, for example, in whether services are (supposedly) offered free of charge (think of the bookcases in some city centers where citizens make books available to interested readers free of charge). On the other hand, provision or mediation may be subject to a fee. Sharing economy covers many sectors and industries (European Commission, 2022). Examples are food, financial, mobility, travel, logistics, work, or education (Puschmann & Alt, 2016, p.2).

Topicality of the Sharing Economy

It should be noted that the sharing economy itself is nothing new. Everyone knows a library – and in principle a library is based on the concept of the sharing economy. A ride-sharing agency is not an invention of recent years. Think of the cooperative model (“Genossenschaft”) that has been established in German-speaking countries since the Middle Ages (DGRV, 2022). What is new today and at the same time massively supports the sharing economy are the opportunities of digitization. Online platforms, (mobile) internet, or social media greatly simplify the networking of suppliers and buyers (Puschmann & Alt, 2016, pp.1 ff.). A worldwide network enables the provision and use of goods significantly. In the economic sense, it can be stated that the costs of organizing the part – of transactions – have fallen significantly as a result of technological achievements. This has contributed to the triumph of new business models in almost all areas of life – think of apartment brokerage, dating, logistics, public

transport in the cities, and the sharing of time and experiences such as the photos of the last vacation trip. Other impacts besides digitization are the focus on ecological impacts, sustainability, or a better value distribution in the supply chain (Cheng, 2016, p.60).

Critical Appraisal of the Sharing Economy

As diverse as the sharing economy is, so different and controversial is the discussion about its advantages and disadvantages. In regard to the companies, it can be seen that the sharing economy and the increased usability resulting from digitization have resulted in a large number of new business models (Cheng, 2016, p.1). Think of the possibility of renting apartments from private individuals for a day or two instead of a hotel almost anywhere in the world, or the flexibility of private individuals taking you in their own car for a fee in a city so you do not need to rely on a taxi. These two companies have experienced enormous economic growth in recent years. New business models for bringing together suppliers and demand create new business opportunities for companies. And the collection of data is also an important business model that is made possible by the sharing economy. Sharing economy can be a source of innovation and new business opportunities (European Commission, 2022).

If you look at already established companies – the example of the hotel industry makes it clear – this “new” competition certainly promotes the incentive to constantly develop as a company in order to be able to continue to welcome guests. Through special (new) service, higher quality, or other things, it is important that companies remain competitive when they are threatened by new companies entering their market segment thanks to the principle of the sharing economy. To put it positively, competition stimulates “business” and forces established companies not to stand still but to develop further. In other words, the sharing economy also increases productivity through established competitive incentives.

One of the points of criticism of the sharing economy is from the point of view of companies: due to the forced structural change, tried-and-tested business models have to be changed – for example, because owning a car is no longer as important as being able to use the car only when you need it. The added value also arises in a completely different place, namely less and less in the production of goods but perhaps “only” in the mediation. It becomes particularly difficult when there are different regulations for market access, i.e., when the requirements differ between a company in the sharing economy and an “old” company that aims at the same product: when a hotel has significantly stricter bureaucratic legal requirements (think about hygiene regulations), it is more expensive than a private provider that does not have to meet these requirements. Although in the example mentioned, the user regulates ex-post through negative customer feedback those providers who (in the example) offer an unhygienic place to sleep, the market access costs are nevertheless different. Disadvantaging established companies is a common criticism of the sharing economy. Under certain circumstances, this will in turn lead to new regulation by the state.

From the user’s point of view, the sharing economy can often be advantageous. Not only does the availability of services or products increase enormously – if you only “share” a car when you need it, it is significantly cheaper than parking your car in front of your house or workplace for most of the day. In addition, greater competition and rivalry can lead to increased price pressure and the use or consumption of a good becomes cheaper. Quantity, availability, and (possibly) a cheaper price can be an advantage for users of the sharing economy.

As a result of less resource requirements for the production of goods and the multiple use of goods, the sharing-economy is often supposed to be more sustainable resource and environmental protection are advantages from a social point of view. Last but not least, the sharing economy can also help to change consumer behavior: if things are available every day and everywhere, you may not need to own them – with the same positive effects on resource requirements.

On the other hand, there are critical approaches to the sharing economy. Platform operators are accused of exploiting their existing market power, not least to take advantage of established companies. Topics such as employee rights, remuneration, or protection against dismissal by companies in the sharing economy are also discussed. Another sensitive issue is the handling of user data from platform companies.

Summary

Sharing economy is about the sharing of goods. They are made available to consumers. Sharing economy connects suppliers of goods and consumers. The advantage is a better distribution of capacities. Nowadays sharing economy is characterized by enormous heterogeneity, regarding the goods or the providers. Nevertheless, sharing economy is nothing new. What is new are the opportunities of digitization and the importance of sustainability which do have a massive impact on sharing economy. In regard to the companies, sharing economy has resulted in a large number of new business models. Sharing economy is a source of innovation. It does stimulate old-fashioned business models and forces to becoming more innovative overall. Otherwise sharing economy forces structural change and comes together with many topics regarding market regulations, etc. From a user’s point of view sharing economy seems advantageous. The availability of services and products increases. By using less resource requirements it might have a positive impact on sustainability at all.

Definition

Collaborative teamworking is satisfactory and productive problem-solving in a group process based on recognizing interdependent tasks and goals, conscious communication, and emergent knowledge building.

Introduction

Teamwork has been a standard in organizations for many years. The use of teams can be traced back to the early twentieth century with the introduction of the assembly line in manufacturing. Rapid technological advancements, the growing need for collaboration between highly specialized professionals, and the economic demands to increase productivity have constantly changed how organizations run their operations. Teamworking in various fields, including business, education, and health care, has many advantages, such as bringing together the expertise of diverse people, allowing for shared responsibility in making decisions, and providing access to more resources and ideas. In working life, the word team is often used as a synonym or general term for all work groups. A *team* may be defined as a community formed by individuals constantly interacting with each other or a group with common goals. Teams can be set up to manage continuous tasks or production, or on the other hand, for only a specific task for a limited life span.

The concept of teamwork began to gain widespread acceptance in the 1980s and 1990s as companies began to realize the benefits of

collaboration and cooperation in achieving business goals (Guzzo and Dickson 1996; Parker 2008; Salas et al. 2000). The rise of technology and the Internet have also made it easier for teams to collaborate remotely, further increasing the prevalence of teams in organizations. In addition, to tackle problems that are too complex for individuals to address alone, organizations have responded by forming teams to accomplish them (Cannon-Bowers and Salas 1998). Particularly solving today's wicked problems requires challenging linear thinking and mechanistic solutions (Grewatsch et al. 2021). Organizations can achieve this by creating collaborative teams not bound by hierarchical structures, siloed resources, and rigid roles but in contrast by embracing the team members' various perspectives and skills and by recognizing the interdependence of different tasks and goals (Parker 2008). Collaborative teams often adopt a systems thinking approach to identify the interconnectedness of different aspects of the issue and how they interact (Grewatsch et al. 2021). Additionally, collaborative teams aim to create shared value (Porter and Kramer 2019), benefiting all stakeholders, not just one group or individual. Efficient collaboration requires open, respectful, and concise communication. Furthermore, positive synergy in teamwork allows emergent knowledge building, which is necessary for innovations (Goold and Campbell 1998). When correctly performed, collaborative teamworking is both satisfactory and productive problem-solving in a group process based on shared values and an awareness of a common purpose (Adler and Heckscher 2018).

Teamwork and Collaboration

In the research literature, the definitions of teamwork vary. On the one hand, teamwork is understood as contradictory or difficult to define; on the other hand, as a clear and specific phenomenon. Sometimes a team is referred to as a cooperative or collaborative experience, but it can also refer to an organizational structure to accomplish a task. A team can be defined as two or more people, with clearly defined roles and tasks, working together

to achieve a common goal, which requires responsive and adaptive cooperation (Salas et al. 2000). A commonly used definition for a team has been provided by Katzenbach and Smith (2005, 165): "A team is a small number of people with complementary skills who are committed to a common purpose, set of performance goals, and approach for which they hold themselves mutually accountable."

Since the 1990s, a growing amount of teamworking has been done virtually. Online communication platforms have provided greater flexibility and global reach for organizations. Virtual teams can include people from multiple locations. However, whether in an online or physical workplace, the team's duties and responsibilities remain the same, requiring effective communication, teambuilding skills, and knowledge management (Holton 2001). Teams are always composed of individuals who rely on each other to obtain a common goal or complete an assigned task (Parker 2008). So, even though a virtual team consists of members located in different places or have different schedules, they still must be motivated by a shared sense of purpose and clearly communicated tasks and roles (Adler and Heckscher 2018; Holton 2001).

The definition of *collaboration* is sometimes close to identical compared to teamwork. However, these can also be approached as two distinct concepts. While teamwork involves a group working together on completing a task or achieving a common goal, collaboration is when individuals with different expertise come together to solve a problem or create something new. Teamwork requires concise communication and clearly defined tasks and roles, but collaboration requires creativity guided by a clear sense of shared purpose, flexibility, and openness to see novel solutions (Adler and Heckscher 2018; Selznick 1957). Teamwork always includes cooperation at some level since achieving the agreed result requires dividing the work among the team members. On the other hand, problem-solving and innovations call for creative collaboration in which individuals can give unique perspectives and develop solutions to a problem in a generative process (Parker 2008).

The concept of synergy refers to the situation in which the combined effect of two or more things is greater than the sum of their individual effects. In the context of collaborative teamwork, synergy refers to the idea that a group of people working together can achieve more than they could individually. This can happen when team members bring different skills, perspectives, and ideas to the table and can work together productively. It can also describe the positive interaction between team members (Goold and Campbell 1998). When the ideas of collaboration and teamwork are combined, there is both individuality and cohesion in the group.

Interdependence

Interdependence refers to the reliance of one person or group on another person or group in order to achieve a common goal or objective. In the context of collaborative teamwork, interdependence means that each team member's actions and decisions affect the other members and that the success of the team as a whole depends on the contributions and cooperation of all its members. Interdependence can be positive or negative. Positive interdependence means that the success of one person or group is linked to the success of others, which can motivate team members to work together effectively. Negative interdependence means that the success of one person or group comes at the expense of others, which can lead to conflict and competition (Tjosvold 1986).

Collaborative teamwork is a dynamic process that necessarily involves interdependence among individuals. Mohrman, Cohen, and Mohrman (1995) state that the team members share goals and are mutually dependent in accomplishing them. However, the interdependence scale may vary in different teams concerning their tasks and goals. Thus, Thompson (1967) has identified three types of interdependence – pooled, sequential, and reciprocal – to illustrate an organization's intensity of relationships and behavior. Examining the interconnectedness of the different teams' or individuals' tasks and goals can assist in comprehending how the achievements of one are

reliant upon the performance of others. This understanding helps organizations make well-informed decisions for their operations.

Pooled interdependence is the least structured form of the three. Here, the teams or individuals are not reliant on others; they all independently perform their own functions. The pooled interdependence model allows departments to work together without interacting directly and being dependent on each other. Each department still provides its input toward the same overall goal (Thompson 1967).

Tjosvold (1986) has similarly identified that in some teams, interdependence between goals is not experienced at all. Then the individuals accomplish their tasks alone, have little interaction with others, and use resources for their success. Even negative interdependence can be experienced when individuals are given separate tasks and personal rewards for success. Individual responsibilities and encouragement for winning make people work for themselves and against others. If the different goals are perceived as negatively linked, the individuals may experience distrust. Conflicts are either avoided or to be won. Resources are used for one's benefit and against others (Tjosvold 1986, 528–529).

Thompson's (1967) concept of sequential interdependence refers to a common phenomenon that occurs when an individual's or a team's output is required for the other's performance. For example, each unit's contribution is necessary for an assembly line to complete the production process. In this kind of organization model, it is critical to use cooperation between the teams to plan and schedule resources well advanced. Doing so avoids delays down the line, allowing for more effective operations (Thompson 1967).

Reciprocal interdependence is comparable to sequential interdependence since the outcome of one team serves as an input for another, which continues in a cyclical form. It increases the intensity of interaction among different teams in an organization. Reciprocal models are complicated to manage because one unit can change procedures and unexpectedly impact everyone else. Thus, the operations require careful management and forethought, but most of all, collaboration

with constant adaptation from each team (Thompson 1967).

Tjosvold (1986) refers to positive interdependence as a team process in which individuals work on a joint project and take responsibility for its progress together. The team members are rewarded together, making them coordinate their activities better and approach their goals as interconnected. Positive dependence on others also fuels fair division of labor and sharing of resources. Positive interdependence also leads to solving conflicts more easily, exchanging abilities, and encouraging team members to help each other accomplish their tasks. These interaction patterns improve the overall efficiency of collaborative teamworking. Shared values and a common vision affect the sense of belonging among the team members. Experienced cohesiveness in the team encourages the individuals to continue further working on joint projects, share rewards, assist each other, and understand that their goals are interconnected (Tjosvold 1986, 528).

According to Thompson (1967), organizations can more efficiently collaborate if tasks are organized according to the intensity of interdependence and managed with specific coordination approaches. The model of pooled interdependence requires standardization, while the other two models are more flexible with coordination styles (see also Steiner 1972). For example, teams with sequential interdependence can be managed successfully through adaptive planning and scheduling. In contrast, teams with reciprocal interdependence operate by constantly exchanging information and making mutually beneficial process adjustments. Therefore, it is essential to understand the different levels of collaboration needed. Sometimes working independently, with minimum interaction with others, is the most effective way. In contrast, collaborative teamworking is guided by a sense of shared purpose (Adler and Heckscher 2018) and involves defining together not only the means of working but also the end goal (Thomson et al. 2009; Wood and Gray 1991).

In addition to understanding task and goal interdependence and how they affect a team's behavior, factors such as personality, beliefs,

values, and behavior also play a role in determining how well individuals interact with each other within a team environment (Tjosvold 1986). In collaborative teamwork, knowing how every individual perceives reality is essential. Someone with a more independent view of reality primarily focuses on their goals and progress. An interdependent view refers to individuals recognizing the collective's importance, and they strive for shared success. It is essential to be mindful of these different perspectives to create a cohesive team environment.

The rewards and control systems can also affect how well the team works together (Tjosvold 1986). Rewards can motivate individuals to work harder and more efficiently, while control systems can help ensure everyone is on task and working toward the same goal. Team members are sometimes pitted against each other to foster competition and increase productivity. This strategy creates a stimulating work environment that encourages employees to achieve better results. However, it can lead to negative consequences such as strain on team relationships.

The potential benefits of teamworking to individual members or various teams in an organization vary depending on the type of work they are doing and their goals. In specific projects, different teams may have goals that seem unrelated to each other at first glance. However, upon closer inspection and analysis, it is possible to identify how these goals are interconnected and mutually beneficial. Fostering collaboration and understanding between teams can help ensure that all their objectives are met efficiently and effectively.

Communication

Teamwork always occurs in communication, where group or team members become aware of each other in various ways. Through communication, the team members' roles, tasks, norms, and rules are determined (Hollingshead et al. 2005). Because collaborative teamworking involves individuals' willingness to work together and share their decision-making, open communication between the team members is essential for an

effective way to accomplish common goals (Kaufmann and Wagner 2017). In transparent communication, the collaborating team members share information and updates about their progress and any challenges they face. Timely communication helps ensure everyone is on the same page and potential risks or issues can be identified quickly. Open communication also creates an environment of trust, which allows team members to feel more comfortable sharing ideas.

The sense of inclusiveness and belonging in collaborative teamwork can lead to increased motivation and engagement and, again, better job satisfaction among employees (Shore et al. 2011). Empathy in organizational communication refers to the ability of individuals to understand and share the feelings of others within an organization (Goleman 1995). It involves actively listening to and trying to understand the perspectives and emotions of others and recognizing that everyone may have different backgrounds, experiences, and communication styles (Alon and Higgins 2005). Empathy in organizational communication involves being sensitive and responsive to the emotional needs of others and being aware of one's biases and assumptions (Shore et al. 2011). It helps to build trust, understanding, and positive relationships among employees, which leads to a more positive work environment, and improved organizational performance.

Teambuilding activities are designed to improve inclusion and communication to strengthen teamwork; however, these events do not typically go beyond the intellectual understanding of communication. Interaction between individuals does not only take place on a cognitive but an embodied level too. Embodiment refers to the idea that our understanding of the world and our place in it is deeply rooted in our bodily experiences (Merleau-Ponty 2008). In other words, it is the idea that the way our bodies perceive and interact with the world around us shapes our thoughts, emotions, and behaviors. In organizational communication, embodiment refers to the idea that communication is not just about exchanging words but also about the bodily presence of the individuals involved (Dale 2000).

Communication is a holistic process that involves not just the verbal and nonverbal messages being exchanged but also the physical context in which those messages are being sent and received. Embodied communication in organizations can include factors such as the physical layout of a space, the body language and facial expressions of the individuals involved, and the use of props or other objects to convey meaning. The concept of embodiment also highlights the importance of intersubjectivity in organizational communication, as the body is the medium through which we communicate with others and the world. With the understanding of embodiment, communication in collaborative teamwork can be perceived more holistically (Dale 2000).

Emergent Knowledge Building

Tame problems are well-defined and have clear solutions, while wicked problems are complex and difficult to define or solve. Tame problems are often technical in nature, whereas wicked problems are multi-layered and include social and political aspects to be considered. Tame problems can be solved using linear thinking and established methods and techniques in teams organized in bureaucratic and hierarchical ways. In contrast, wicked problems require systems thinking, embodied communication, and more adaptive approaches (Rittel and Webber 1973).

Wicked problems, such as climate change, nature loss, poverty, and many others related to ecological and social sustainability, are complex and have high uncertainty and unpredictability. They also have multiple causes, and they tend to change over time. Thus, addressing wicked problems requires collaboration and systems thinking. The systems thinking approach involves understanding the problem in the context of the more extensive system in which it occurs (Hossain et al. 2020). It helps to identify the underlying causes and interconnections of the problem. Thus, systems thinking offers a creative and adaptive approach to addressing wicked problems. Experimenting with different solutions and being open to new ideas can help to find innovative

solutions and adapt to new information and changing circumstances.

Wicked problems often involve multiple stakeholders with conflicting values (Carney et al. 2011). Communicating effectively with various stakeholders and being transparent about the problem-solving process can build trust and support for the solutions. Creating shared value (Porter and Kramer 2019) is essential for sustainable innovations. Collaboration across different sectors and disciplines can generate new ideas, products, or services that benefit the company and society at large. Solving wicked problems cannot be reduced to a simple cause-and-effect relationship; thus, embracing the complexity and uncertainty of these issues can help to rely on emergent knowledge building in finding sustainable solutions for them. In other words, when addressing wicked problems, it is essential to understand that the solution is a process in which the team needs to continuously learn and adapt.

Emergent knowledge building refers to the process of creating new knowledge through the interactions and collaboration of individuals or teams. It is a bottom-up process, where knowledge is created and shared through the collective efforts of team members rather than being imposed from the top down by a single individual or authority. Emergent knowledge building can occur through various activities such as problem-solving, decision-making, and brainstorming, where team members work together to generate new ideas. It is often associated with collaborative teamwork and characterized by an open and dynamic process where knowledge constantly evolves and adapts to new information and situations (Cress and Kimmerle 2008).

An egalitarian team is a type of collaborative team in which all members are considered equal in the decision-making process. Egalitarian teams are characterized by a flat organizational structure and a lack of hierarchy, where all team members are considered peers and have equal status (Weinberg et al. 2011). In an egalitarian team, decision-making is often done through consensus, where all members can express their opinions and ideas, and a decision is made only when all members agree (Yngvesson 1978). In practice, it might

only be possible to partially achieve the egalitarian team ideal since some leaders or members may hold more power or influence than others, which can lead to challenges in terms of communication and decision-making (Weinberg et al. 2011). In egalitarian communities, a controversial decision is made not necessarily through consensus but by distributing responsibility among all the members of the group, so no single individual can take credit or blame for it (Yngvesson 1978). Egalitarian teams focus on collective goals and objectives rather than individual achievements. Bringing together diverse knowledge and perspectives in inclusive, egalitarian teams can lead to the creation of novel solutions and breakthrough innovations.

Summary

Collaborative teamwork refers to a group of people working together to achieve a common goal or objective. It can be applied in various settings, including business, education, and healthcare, and is often seen as an effective way to accomplish complex tasks, solve problems, and generate innovations. Thus, collaborative teamwork is particularly helpful for solving wicked ecological and social problems where traditional linear thinking, conservative solutions, and hierarchical teams fall short. When done correctly, it is a highly effective and satisfying problem-solving model in an organization that combines individual but interdependent skills and roles and encourages everyone to work together to achieve a shared purpose. An equitable working environment encourages teams to maximize their potential and improve outcomes. However, efficient collaboration in a diverse team requires respectful communication between all its members. Responsible collaboration between specialists from various fields and diverse expertise allows emergent knowledge building and can thus initiate a more productive problem-solving process based on synergy. Moreover, collaborative teamworking increases job satisfaction and offers a sense of purpose that can lead to innovative solutions. Therefore, it is vital to recognize the potential of collaborative teamworking in organizations

aiming for sustainability and to create a working environment that encourages and supports it.

Collective Bargaining

Alexander Kriebitz

Technical University of Munich, Munich,
Germany

Synonyms

Coordinated wage bargaining; Wage and salary negotiation

Definition

The term collective bargaining describes the negotiation process between employers and organized labor aimed at agreements to regulate working salaries, working conditions, benefits, and other aspects of workers' compensation and rights for workers. The purpose of collective bargaining is to allow the representation of interests of employees by trade unions and the organization of strikes in order to enhance the pressure on corporate decision makers to make concessions to the workers. The process of collective bargaining can include elements such as strikes and work stoppages. Collective bargaining has existed in this sense since the end of the nineteenth century, especially in Europe and North America. Given the social question prompted by industrialization, the original aim of trade unions was to improve the living conditions of the working class in terms of better working environments, working times, and compensation. Major human rights treaties and documents have formalized the right of worker self-determination and defined them as a human right.

Introduction

The right to organize and bargain collectively with employers is a privilege that employees have fought for decades. The ILO Convention No. 154 has produced a definition of collective bargaining as:

All negotiations which take place between an employer, a group of employers or one or more employers' organisations, on the one hand, and one or more workers' organisations, on the other, for:

- (a) determining working conditions and terms of employment; and/or
- (b) regulating relations between employers and workers; and/or
- (c) regulating relations between employers or their organisations and a workers' organisation or workers' organisations. (Article 2)

The negotiations stated in the ILO Convention N. 154 can include grievance mechanism as well, allowing employees to report violations of labor rights or violations of negotiated agreements. A further purpose of collective bargaining is to allow the representation of interests of employees by trade unions and the organization of strikes in order to enhance the pressure on corporate decision makers to make concessions to the workers. Examples would be “work councils” (Staples and Whittall 2020) or safety and health committees mandated by law and allowing representatives to influence decisions concerning occupational health (Gramberg et al. 2020; Kuruvilla and Li 2021).

Apart from the understanding of collective bargaining as a human right, collective bargaining and explicitly trade unions play a mediating role for moderating social conflicts and have a wider societal purpose. In particular, collective bargaining is understood as a means to compensate for the imbalance between companies and the workforce in terms of in terms of socio-economic power and is widely regarded as a right of organized labor vis-à-vis the employer for securing other human rights (see Mantouvalou 2012). While the exact economic impact of collective bargaining on aspects such as inflation and

inequality is part of a wider theoretical debate in economics, the international human rights discourse has stressed the relevance of worker representation, freedom of association, and collective bargaining. Examples for the integration of collective bargaining as a human right manifest in major conventions including the Universal Declaration of Human Rights, the International Covenant on Social, Cultural and Economic Rights, International Labour Organization, and the UN Guiding Principles on Business and Human Rights. In the wake of globalization, the question of how to realize these rights in international supply chain has evolved as a major aspect of the international human and labor rights discourse.

Collective Bargaining in History

Collective bargaining is often understood in a wider historical context of worker representation and codetermination (Collins et al. 2018; Mantouvalou 2012). The modern understanding of collective bargaining emerged in the late eighteenth century, when trade unions were established as an organization to represent the interests of workers. In the wake of industrialization, the emergence of a right to collective bargaining played a specific role for settling the distributional conflicts coming along with the economic transformation of Europe and North America in the nineteenth century. Initially, the notion of collective bargaining and the institution of trade unions attracted hostility from employers and government groups that regarded these new groups as a threat to their power, explaining the legal situation in most of the nineteenth century, which prohibited trade unions. Given the social question prompted by industrialization, the main aim of trade unions was to improve the living conditions of the working class in terms of better working environments, working times, and compensation. Therefore, trade unions responded to the “social question” in Europe and varied in terms of political affiliation (politically neutral, confessional, or socialist). Some of these different traditional types of trade unions have remained

until today such as Christian Trade Union Federation of Germany (CGB).

On the turn to the twentieth century, the role of trade unions was strengthened by political events and the emergence of Socialist parties demanding collective bargaining. British trade unions were legalized in 1872, after the Royal Commission on Trade Unions in 1867 agreed that the establishment of the organizations was to the advantage of both employers and employees. The changed attitude of the German government following the retreat of Chancellor Otto von Bismarck sparked an end to the Anti-Socialist Laws which were repealed later allowing for the creation of trade unions in Germany. Moreover, the encyclical “*De Rerum Novarum*” issued by Pope Leo XIII, acknowledged the basic principles of collective bargaining, freedom of association, and the role of employee codetermination. Further steps of legalization and acceptance of trade unions and collective bargaining were the Stinnes-Legien Agreement in Germany, enshrining and reaffirming major labor rights including the right to strike and to form trade unions.

Reaching their peak in the 1950s and 1960s, trade unions evolved as a dominant factor in European and – to a different extent – North American politics. Mass strike co-organized by trade unions often included a substantial proportion of the total labor force and occurred, for example, in the 1926 United Kingdom general strike illustrating the political role of collective bargaining. In this sense, strikes were not only meant for worker representation in a specific company, but also directed at political changes of a more general nature and contributing to the political weight of the labor movement of the early twentieth century. Trade unions influenced here national legislation on working hours and days, as well as legislation against child labor in Europe. This process was partly accompanied by the emergence of trade unions restricting themselves to single occupational groups. Prominent examples are here the IG Metall in Germany (Industrial Union of Metalworkers) or the United Auto Workers in the United States and Canada, which played a significant role in American party politics and unfolded a strong impact on wages in

North America's automotive sector (see Katz et al. 2013). Other trade unions focused on the public sector and on white-collar jobs largely representing administrative and technical employees.

Starting with the late 1970s, politicians in the West particularly in the United Kingdom and the United States sought to liberalize the economy and heavily collided with the interests of organized labor. With the proclaimed aim of restoring "a fair balance between the rights and duties of the trade union movement," Margaret Thatcher sought to limit the role of trade unions, especially addressing the state sector (Hanson 2016; Mitchell 1987). This development appears to appear to have manifested over time in a declining socioeconomic status of trade unions accompanied by a higher level of individualization in the labor markets. Similar events unfolded in Germany at the turn of the millennia, when the Agenda 2010 liberalized German labor markets and resulted in cut-backs of social spending, drawing criticism from trade unions. These developments appeared to have contributed to a tendency that even countries and economic sectors with apparently robust rule-based labor relations systems experienced a decline in union density and centralized bargaining (Baccaro and Howell 2017; Kuruvilla and Li 2021).

Collective Bargaining in Collective Bargaining in Economic Thought

The right to collective bargaining is featured prominently throughout different economic theories, including the writings of Karl Marx, John Maynard Keynes, Friedrich August von Hayek, Milton Friedman, and other economists, who have contributed to the contemporary assessment of trade unions and their political or economic role (Rivot 2012). This debate is embedded in the larger normative debate on the role of property rights, entrepreneurial freedom, economic inequality, and worker representation (Collins et al. 2018). A general critique on the right to collective bargaining has primarily manifested in approaches pointing out the role of competition

and market prices as the most efficient tools for determining wages for employees. From this perspective, Friedrich August von Hayek has argued that unemployment is to be explained by pricing and that the right to collective bargaining driving higher wages increases unemployment (see Richardson and Roberts 1997). Other theorists including Milton Friedman pointed out that collective bargaining constitutes a major cause for unemployment (Schwarzer 2018), although this claim has been dismissed by others (Pissarides 1986). Further economic theories tried to establish a linkage between the role of trade unions in the economy and the distribution of wealth and income. Studies have underpinned the argument that unions reduce inequality as demonstrated in the case of the United States and that a weaker role of unions might drive up wage disparities (Farber et al. 2018; Michin 1997). Along these lines, the aspect of union-wide wages and wage centralization plays a major role (Dawid et al. 2021).

Collective Bargaining as a Human and Constitutional Right

While the impact of globalization on labor standards remains a subject of academic debate (Chan 1998; Neumayer and De Soysa 2006), international coordination of labor rights played an early role in the labor movement. This has manifested in the foundation of the International Workingmen's Association in London in 1864 and in the foundation of the International Labour Organization, in the aftermath of the First World War in 1919 (see Valcitos 1998). For addressing the challenges of globalization to labor rights, conventions of the International Labour Organization such as ILO Convention No. 154, Right to Organise and Collective Bargaining Convention, 1949 (No. 98), or the Labour Relations (Public Service) Convention, 1978 (No. 151) have generated implications of collective bargaining for companies. Moreover, collective bargaining and the instrument of worker representation have here been understood as an instrumental right to guarantee other human and labor rights such as occupational health and safety, fair compensation, and nondiscrimination (Metcalf

et al. 2001). As a result, major human rights treaties and documents have formalized the right of worker self-determination and defined them as a human right. Article 23 of the Universal Declaration of Human Rights refers to the “*right to form and to join trade unions for the protection of his interests.*” Likewise, Article 8 of the International Covenant on Social, Cultural, and Economic Rights in 1966 has reaffirmed the “*the right of everyone to form trade unions and join the trade union of his choice.*”

On a constitutional level, the realization of the right to collective bargaining is widely differing. The right to collective bargaining has been enshrined in Article 28 of the Charter of Fundamental Rights, stating that:

Workers and employers, or their respective organisations, have, in accordance with Union law and national laws and practices, the right to negotiate and conclude collective agreements at the appropriate levels and, in cases of conflicts of interest, to take collective action to defend their interests, including strike action.

Moreover, the right to collective bargaining has been formalized in national codifications such as Article 9 of the German Basic Law or Section 1 of the US National Labour Relations Act. A particular challenge arises in states that have not signed the ILO Convention on Freedom of Association and Protection of the Right to Organize though. Specifically, authoritarian regimes tend to control trade unions and to prohibit worker codetermination, allowing foreign investors to reap profits from the suppression of organized labor (Kopper 2021; Kuruvilla and Li 2021). As a result, the UN Guiding Principles of Business and Human Rights have stressed the role of global responsibilities in terms of labor rights and referred explicitly to the major codifications of the ILO as international standards. Although the UN Guiding Principles are soft law, they have influenced the ongoing debate on due diligence in the supply chain and the positions of companies on international collective bargaining practices. The United Kingdom was here one the first countries to implementing the United Nations Guiding Principles on Business and Human Rights (UNGPs) in the form of a national action plan, including the United Kingdom Modern Slavery

and Human Trafficking Act (LeBaron and Rühmkorf 2019). These efforts notwithstanding, many observers have noted the importance of enhancing already existent measures to realize a better protection of human rights and the right to collective bargaining in particular in countries with lower labor rights standards. In this sense, the United Nations Sustainable Development Goals, which have been prominently outlining “Decent Work” as a major pillar of development policies, contribute to a more holistic approach for getting sense of the overlap between international development policies, structural poverty, and labor rights.

In order to fulfill the responsibilities originating from UNGPs, multinationals need to design policies safeguarding ethical conduct. Principle 11 of the UNGPs outlines that “Business enterprises” should respect human rights. This means that they should avoid infringing on the human rights of others and should address adverse human rights impacts with which they are involved.” One instrument to prevent violations of the right to collective bargaining is the code of conducts regulating the collective bargaining in specific companies. Likewise, global framework agreements governing industrial relations (Hammer 2005) and world company councils or social charters are here seen as instruments of standardizing the collective bargaining policies of multinationals and creating global minimum standards. Nevertheless, navigating between these challenges presents a major challenge for international companies. Research has shown that private regulation (corporate codes of conduct) has not yet overcome institutional settings hostile to the enforcement of collective bargaining standards (Santoro 2000; Santoro 2018). Moreover, research has demonstrated the difficulties in remediating collective bargaining standards in the supply chain of Western companies (see Van Liemt 1989; Anner 2012). Likewise, research that is more recent ponders on the influence of digitization on traditional collective bargaining practices (see Vandaele 2018). Combined with the decline of unionization in Western countries, these questions represent the key academic and practical challenges for realizing the

internationally guaranteed rights to collective bargaining and link up to the more general human rights and globalization discourse.

Summary

Collective bargaining is not accepted in all constitutions as a fundamental right, what makes it difficult for international companies to establish international protection for workers seeking to unite. Collective bargaining is therefore more contested on a theoretical level than other human rights. The roots of anti-union legislation are manifold, and the protection of trade unions or the right to collective bargaining is not self-evident even in many Western countries. For aligning with international norms on collective bargaining, companies can orient themselves to the ILO conventions or to the UNGPs, which inform corporate decision makers on strategies how to implement union rights in hostile environments. Companies can make a difference by engaging in company-specific policies to create a good institutional environment for protecting the interests and rights of workers in hostile cultural or political settings. As goodwill on behalf of company is not enough, the creation of minimum standards in tandem with international supply chain legislation depict important moves to anchor participation rights internationally.

Alteration; Change; Metamorphosis; Transformation; Variation

Description

Organizations face increasing pressures in the form of environmental disasters, resource depletion, and societal and industry demands which require them to become more sustainable in their operations. Standard ways of doing business no longer are enough. Organizations must make intentional changes in their philosophy and values, products, processes, or practices, in order to create and realize social and environmental value in addition to economic returns. To do so, they must innovate. These innovations can range from changes in operational efficiencies to transformational shifts. This entry defines innovation, especially sustainability-oriented innovations, and discusses how such innovations emerge and spread. Communication is key to any innovation process. Communication is discussed in terms of environmental scanning and information acquisition which occurs as part of the complex adaptive system model, diffusion of innovation, leader framing and management of meaning, internal communication systems and channels, strategic communication, and organizational culture norms. Both internal and external innovation champions and sustainability communication practitioners must emphasize the ease of implementing and realizing and advantages of innovative sustainability practices.

Defining Innovation

Innovation is a construct used and defined by various fields of study, which makes it very difficult to define. However, Baregheh et al. (2009) offer a very useful definition of organizational innovation writing that, “Innovation is the multi-stage process whereby organizations transform ideas into new/improved products, services or processes, in order to advance, compete and differentiate themselves successfully in their marketplace” (p. 1334). Innovations involve two intertwined dimensions: processes (how something is done) and outputs (what is done). Innovations begin with an idea which leads to new/improved products, services, or processes. Organizational innovation is driven by things such as the desire for advancement, market competition, and the need for differentiation in organization’s market. Organizations seeking to embrace sustainability initiatives may adopt a series of multiple pragmatically focused smaller innovations (e.g., engage in new eco-efficiencies) so as to improve their existing policies, procedures, practices, and products. However, other organizations may adopt more transformational innovations and disrupt their current policies, procedures, practices, and products which redirect them toward significantly different directions (e.g., adopting the principles of biomimicry).

Innovation Emergence

Regardless of the nature or extent of the innovation, the process of adopting innovations consists of three very general parts – initiation, adoption, and implementation. During the initiation phase, organizational members recognize the need for and availability of a particular innovation, initially evaluate it in terms of its suitability for their organization, and then propose it for their organization’s adoption. The adoption phase refers to the decision-making process which includes a deeper evaluation of the effectiveness and financial viability of the proposed innovation. Lastly, during the implementation phase, the innovation is often

modified, prepared for the organization's use, and used for a trial period. If the innovation works and is accepted by its users, ultimately it becomes a routine in an organization (Damanpour and Schneider 2006). Sometimes, however, an innovation's adoption can be more spontaneous and less rationally evaluated than this three-phase process implies.

Various things influence an innovation's adoption including an organization's environment (e.g., market needs, competitor actions), leadership demographics and style, organizational dynamics (e.g., complexity and size, resource allocation, and organizational culture) and business processes (e.g., project management) (Crossan and Apaydin 2010), as well as breakthroughs made by engineers and scientists.

Sustainability-Oriented Innovation

While global and national businesses have always invested in innovations in hopes of positively impacting their financial bottom line, increased pressures from nongovernmental agencies, governments, competitors, citizens, and other external and internal stakeholders are pushing organizations to become more sustainable (Varadarajan 2017). Organizational innovation in terms of sustainability has been addressed through a concept known as sustainability-oriented innovation (SOI) which has been defined as "making intentional changes to an organization's philosophy and values, as well as to its products, processes or practices, to serve the specific purpose of creating and realizing social and environmental value in addition to economic returns" (Adams et al. 2016, p. 181). SOI focuses organizations on developing new products, processes, and business models that simultaneously benefit the economic, social, and environmental sides of the business. To begin a systematic search for potential innovations, practitioners complete a quick audit of their existing sustainability-oriented practices to identify any gaps and easy changes where innovations are needed.

There are different approaches to SOI. The SOI process can either be slow and incremental

(operational optimization) or radical and disruptive (systems building). The *operational optimization* SOI refers to organizations that use innovations to reduce the negative consequences of their business activities. For example, an operational optimization happens when organizations implement a new system that lowers CO2 emissions into the atmosphere. Operational optimizations often involve modifying already developed procedures and processes to address sustainability-related issues. Many organizations make operational optimizations to meet industrial regulations or improve their production efficiency and effectiveness. Few organizations move beyond operational optimization, because doing so requires a more radical approach to innovation – the *systems building* SOI. Systems building organizations recognize that simply reducing harmful influences on the environment is not the same as preventing harm to the environment. Proponents of this approach argue that even though some organizations are incrementally improving their production mechanisms to become more environmentally and socially friendly, that approach does not lead to sustainability. Organizations must experiment and not be afraid to create radical business model changes and alternative delivery systems for their products, as well as address the social elements associated with sustainability in a radically different way. Before senior-level management even attempts to spread *operational optimization* or *systems building* innovations throughout their organizations, it is important to understand how innovations emerge.

SOI Emergence

Nair et al. (2016) proposed a complex adaptive system (CAS) model to explain how environmental innovations emerge in organizations and spread through a supply network. Here, we focus on the first four steps of the model that deal with the SOI's emergence. Although we primarily discuss it within the context of a leader's role, other organizational members may identify, recommend, and champion an innovation. As in our

earlier discussion of the stages of an innovation's adoption, SOI emergence starts with exposure to outside influences. Changes in market and industry regulations can cause organizations to innovate (an example of operational optimization). Top leaders (e.g., CEO, board members), organizational boundary spanners, and other employees might also be exposed to new ideas from a variety of sources as was the case for Ray Anderson, the late CEO of Interface, when he read Paul Hawken's book *The Ecology of Commerce*. This first step is called *sensing*. Organizational leaders and members observe the changes and understand that those changes can or should affect their businesses. That leads to the second step – *intuiting*. After organizational leaders and members first notice changes, it is hard to make informed decisions because there is not enough information available. Therefore, they must intuitively make decisions based on their industry-related experience and perceptions. The next step is *interpretation*. Abstract ideas came out of the process of intuiting and now must be understood by everyone. By interpreting these abstract ideas, organizational leaders and members create shared understanding of how to develop SOI. Lastly, it is important to *structure* the proposed SOI changes. One way to do this might be to set up a task force or a sustainability department which will be in charge of carrying out various new sustainability-related practices. Structuring also involves grouping sustainability practices together. For example, if an organization identifies ways to improve its diversity and inclusion practices, that would be related to the social aspect of sustainability and should be labeled as such along with other social-related initiatives (e.g., workers' rights). Additional steps of the CAS model focus on diffusing and amplifying information on sustainability practices. These steps will be discussed in subsequent sections. Throughout the CAS model, communication plays an important role in knowledge acquisition (sensing), interpreting, organizing (structuring), and dissemination – indeed, throughout the overall process of SOI development and implementation.

SOI and Communication

This section discusses communication in terms of external knowledge. The importance of sustainability has grown significantly over the last two decades. Sustainability is rapidly moving from being just a part of the corporate social responsibility framework to being an essential standard for well-developed organizations. Given the swift shift to a new sustainably focused business environment in many sectors, often extensive information or knowledge on sustainable development and innovations is not present in an organization. Organizational leaders and members must reach beyond their internal knowledge resources to seek outside expertise. Two of the five most important priorities in creating organizational innovations are (1) accumulating and sharing internal knowledge and (2) gathering and integrating external knowledge (Dess and Picken 2000). Organizational leaders and members must exchange information with inside and outside entities to initiate change (innovation) and propose new ideas for adoption. Decision-makers often rely on external communication to make well-informed decisions. But organizations must have the capacity to use the external knowledge. Internally, communication becomes essential when modifying and spreading information about an innovation as well as empowering employees to identify and propose new innovations. Once innovations are recognized, they spread throughout an organization via strategic communication structures and framing (see Allen 2016).

How Innovations Spread

As we approach the end of the second decade of the twenty-first century, sustainable innovations are crucial not only for preserving our environment but also for preserving the business practices that depend on the fast-diminishing resources such as fossil fuels (Reed 2002). While the existence of sustainable innovations (e.g., new technologies, new resource mapping which allows for increased conservation) is important, such

potential innovations are only effective if they spread between and within organizations, supply chains, industries, and nations. Diffusion of innovation theory (Rogers 2003) is a key theory which sheds additional insight into the process of how innovations spread at multiple levels (e.g., organizationally, nationally). Rogers proposed an S-curve of adoption whereby within any social system there are innovators, early adopters, early majority, late majority, and laggards. He identified the characteristics of the various groups, the elements of an innovation which make it more or less attractive and spreadable, the role of key communication roles such as innovation champions, and the communication process which begins with knowledge followed by persuasion, decision, implementation, and confirmation. This model has been applied to how various organizations adopt and embrace sustainability (see Allen 2016).

Sustainable innovation within organizations must be powered by employee participation. Identifying potential innovations and adopting a new, sustainability-focused business model are admirable but useless if there are no employees who will think like entrepreneurs in terms of sustainable practices (Geradts and Bocken 2019). Before employees can participate in finding and enacting sustainability-related innovations, they must be aware of whether or not their organization has a sustainable mission, vision, goals, or strategy and understand the specifics of any sustainable strategy being implemented. Communication plays a very important role in this process. Internal communication in its various forms (e.g., internal publications) can be used to simultaneously disseminate information about new and/or best sustainable practices and recognize employees involved in championing the new innovation (Reed 2002). Communication is key for building an internal sustainability-oriented culture focused on continual improvement and transformational change, that is, a learning organization (Senge 1990). The management of meaning perspective of leadership (Smircich and Morgan 1982) and the idea of transformational leadership (Bass 1985) both focus on the importance of how leaders can articulate and frame the need for transformational

innovations. In addition, individuals and small groups are empowered to champion and adopt innovations through strategic communication at the organizational and leader levels. Finally, communication networks and processes allow for the dissemination of information about the potential utility of and ways to enact new innovations. Over time, employees come to accept sustainable innovation as their professional worldview, which will keep them engaged in the process of continually innovating for more sustainable practices.

Furthermore, external communication can and should be used to share and champion best practices with supply chain members and industry leaders interested in implementing new sustainable innovations. It is through innovation champions that diffusions are spread along supply chains and industry fields. Both internal and external sustainability communication practitioners must emphasize the ease of implementing and realizing and advantages of sustainability practices (Smerecnik and Andersen 2011). If an organization's stakeholders perceive sustainable innovations as being difficult and complicated, the innovations will not get adopted, let alone spread.

Summary

Increasing attention needs to be focused on the powerful role of communication in enabling organizational members to recognize potential external innovations (both operational and transformational) they might use to enhance their sustainability initiatives (Allen 2016). Once innovations are recognized, formal communication structures can be put in place using mechanisms such as cross-functional teams and shared information repositories to promote an innovation's spread within an organization. Beyond that, employees can be encouraged to search for and try out potential useful innovations, to champion them internally, and to help create an organizational culture focused on continual transformation. Strategic communication goes beyond routine public relations and internal communication efforts to enlist all organizational employees

in making continual innovations. Continual innovations are key to successful organizational operations in a changing environmental and social landscape. Strategic communication is also key to the sharing of innovations across supply chains, through interorganizational networks, and within organizational fields as environmental disasters and shrinking resources create global challenges to continued economic and social well-being.

Communication Climate and Culture

[The atmosphere of personal relationships/interactions within organization](#); [The emotional tone of a relationship between two or more individuals](#)

Definition

In order to understand human communication climate and culture, it is necessary to understand limitations created by models of communication.

Basic type of communications is mixed meaning that messages include not just information, but also a persuasion element, and are not of just one channel type, say verbal, written, via facial expressions or gestures. Here the general rule is simple – the more formalized the type of a communication, the less space for informal aspects of a message. This stands for quite formalized written communication types such as formal letters, memos, requests, complaints, etc.

However, written communication is often accompanied by previous, parallel, or later verbal communication which no matter how formally regulated it may be, will always include some informality. Verbal communication types vary from simple and formal, such as simple tasks, obligations, requests, and similar to quite complicated such as discussions, decision reaching processes, negotiations, etc. Here the same rule applies.

Introduction

Communication (Lat. *communicare* from *communis* = common) means literally “to make common” and derivatively “to share, to join, to participate in” (Harper 2017). Communication is essential for survival and for the quality of living of all living beings in a way that quality of communication contributes the quality of living, and communicating that something is, for instance, eatable and drinkable or not, a danger or a safety, a shelter or a risk, a passage or an obstacle is of essence for survival as before 100,000 years, so in the twenty-first century.

Let us suppose that a member of old *Homo sapiens sapiens* tribe was sent to find water and that she comes back exhausted and starts to describe the path she found. The tribe sends a group and they bring the water. What she was doing was communicating the information. We know that because the group found water and did it because she used signs that they understood and interpret in the correct way in order to learn it and find the water.

We know it also because she used the signs in a proper manner and calmly making sure that they

understand her and because she asked the leader to repeat the path in order to see did he or did he not remembered it correctly. Without communicating this message completely, correctly, and in a proper way, there would be no water for the tribe, and eventually they would be in great danger after few days.

However, many if not all living being communicate. Some use chemical substances; electric impulses; seismic movements; thermal radiation; scent and different smells; movements, i.e., quite complicated movements like in human dances; sight; and only some like humans use sounds (Witzany 2014). It is important to understand that sound communication is quite rare among living creatures.

Anthroposemiotically speaking, it is unknown how primates, especially modern humans, started to articulate their communication sounds into what we know as speech and language. Some physical prerequisites were needed, like development of particular regions of the brain cortex, tongue, lips, larynx, and respiratory control (e.g., it is very hard for a quadrupedal hominid to have respiratory control for talking if he or she is using front legs or arms for movement and protection most of the time). Some speculations claim that besides physical conditions, some psychological and social were needed as well, or constant situations in which the communication was needed (like hunting, feeding, grooming, etc.).

There are various theories about the origin of speech sounds in humans even in the twentieth century, but none of them was proven (Botha and Knight 2009; Christiansen and Kirby 2003; Harper 2017; Tallerman and Gibson 2012). Since we don't know the origin of speech, and consequently the origin of language as well (Knight 2016), this influences our tendency to improve our current communication, since if we don't know what it is, it's harder to know how to improve it. The sound communication, i.e., speech and language, which we use to communicate complicated messages, isn't reserved for us only. Some mammals use complicated communication (e.g., types of roars in lions). Primates can also learn human sign language. Some primates produce complete words as sentences with

specific semantics (like the word “krak” for leopard alarm or “hok” for eagle alarm by monkeys) (Prigg 2014).

Speech and language, as it is common anthropological knowledge, among modern *Homo sapiens* evolved around 500,000 years ago, but it is possible that the beginning of this process was much earlier. Therefore, it is important to understand that human speech and language is not specific for humans. What is specific is that we developed complicated languages, natural as well as artificial (like mathematical or logical).

Last, but not least, humans have invented and developed computers and robots that use their own programming languages and can communicate with us and with each other. Human communication nowadays includes the use of machines, especially computers and similar so that much of communication is done online. This use changed the way in which we write in our natural languages (e.g., by using new abbreviations, icons, and symbols for the whole sentences).

It is not just that humans are talking to each other via computers, but also that they are communicating among them, and computers and robots are communicating to humans. On March 22, 2016, a robot named “Sofia” to the question by her creator David Hanson “Do you want to destroy humans?” answered “OK. I will destroy humans” (Parsons 2016). It is not known was this a trick or not, neither did she understood that Hanson was joking with her, so she thought she said something funny, or did she really meant it, and besides that the irony is that she was made to be used as a “sex robot.”

On July 21, 2017, it was reported that “[a]n artificial intelligence system being developed at Facebook has created its own language. It developed a system of code words to make communication more efficient. Researchers shut the system down when they realized the AI was no longer using English.” Machines Bob and Alice started to communicate with each other without human control. First, experts thought that they were talking gibberish since Bob said to Alice “I can i i everything else.” and Alice responded “Balls have zero to me to me to me. . .” (Walker 2017).

It is not the point that robots developed some kind of AI unknown to us, rather the point is that our communication becomes more digitalized and that the industry is rapidly developing, so that our communication rules, practices, and standards may radically change during twenty-first century, and we should be aware of it, because, as said, our survival at least in part depends on it.

In what follows, basics of communication climate and culture, with emphasis on workplace and business communication, will be described, types of it will be explicated as well as the most frequent mistakes that we make while communicating in various ways, places, times, and with different persons and machines, and some further notes on possible developments of human communication will be suggested (for development and changes, see Rentsch 1990; Schneider et al. 1996).

Phenomenon of Communication Climate and Culture

Study of human communication (anthroposemiotics) is a study of human communication which is important in order to understand how we live (Stacks and Salwen 2009). Communication climate and culture has dual origin and status. On the one hand, it depends on individual communication know-how, skills, technique, and experience, and on the other hand, it depends on applying individual communication know-how to many different, big, and diverse groups of people in different situations, places, and times. Both aspects of this origin needs to be learned, developed to possible novelties, and adjusted to new circumstances.

There are many myths about human communication some of which are exaggerations, such as the one which says that humans learn to communicate naturally and that nothing further should be learned. If this would be correct, then none of the frequent mistakes in communication would ever happen, yet they do happen and quite frequently (Budd and Ruben 1975).

Another, quite opposite myth, says that communication is loaded with scientific theories and

models that need to be learned for a good communication practice. First of all, as far as “the meaning of a word is its use in the language” as radically claimed by philosopher L. Wittgenstein (Wittgenstein 2009§:43) and nothing more, so by analogy one could suggest that the meaning of communication is just its use in life, since “the speaking of language is part of an activity, or of a form of life” (Melville and Krkač 2015; Wittgenstein 2009 § 23).

On another occasion, the same philosopher wrote: “(Picture: two professors in front of a bridge under construction.) Voice from above: ‘Fotch it dahn – coom on – fotch it dahn A tell tha – we’ll turn it t’other road sooin!’ – ‘It really is quite incomprehensible, my dear colleague, how such complicated & precise work can be carried out in this language’” (Wittgenstein 1998). This story nicely shows that our communication, no matter how complicated it may be, still it is learned primarily as a know-how because it is a skill and technique connected with other actions, rather than theory that needs to be applied.

Last but not the least, among great myths about human communication is that it is mainly verbal, propositional, and relational. Concerning verbal, it is quite sufficient to recognize that basic human communication includes not just speech but closely connected with it a body language which is complicated form of nonverbal communication that includes physical expressions (facial, gestures, body postures, etc.), specific forms (e.g., oculusics, haptics, proxemics, etc.), movement (i.e., kinesics), and tone of voice (Klima and Bellugi 1979).

Concerning propositional nature of communication, philosopher J. L. Austin established the so-called descriptive fallacy which says that, opposed to what positivists claimed, not all meaningful statements are true or false, but only “constantives,” while “performatives” (such as promises or declarations) are meaningful but not statements and are such under different conditions (Austin 1976).

Austin observed that there are a lot of utterances that we frequently use on daily basis but which are not “locutionary acts” (i.e., claiming that some state of facts occurs or not, for instance,

“Train.” in the case that a child is standing by the train and pointing to it) and that some are obviously meaningful and “illocutionary acts” (“Train!” as surprise) or “perlocutionary acts” (“Train!” in terms of danger if one is near to the rails). So, he claimed that not much of our utterances are constantives, rather performatives, and that the later are in fact acts, not primarily verbal expressions because they tend to express an action and sometimes that causes an action (e.g., “Be careful of the train coming!”).

Connected with this myth, and especially concerning with contemporary usage of various computer generated symbols (like emojis, smileys, and similar), human communication isn’t basically letters or words, but pictograms, ideograms, non-alphabetic signs, symbols, etc. (it is sufficient that one observes daily urban environment and how many non-alphabetic signs and symbols surround us) (Poe 2011).

The last myth is that communication is relational meaning that the core of communication is just passing the content of a message from one person to other. This myth neglects the rhetoric nature of human communication which, from Aristotle to the present day, suggests that it is based on influence and persuasion, however, as Aristotle claimed, further on based on rigorous argumentation. It is enough to observe how hard it is to pass simple information to other person without any persuasion or influence, i.e., not to add any persuasive content to the information, not to persuade with tone of voice, rhythm, and tempo of pronunciation, facial expressions, gestures, etc.

Given all mentioned myths and simple mistakes, it can be said that communication climate and culture are two sides of the same coin which is an average level and quality and quantity of communication within any group acting as a formal or informal trying to achieve some goal. It can be private (in a family or among friends), public (in formal bodies of a government), and corporate (within companies, and related to their external stakeholders, e.g., suppliers, buyers, customers, markets, media, etc.). One side of the coin is the subjective and the other is objective.

The issue here is that sometimes climate is called subjective and culture objective and

sometimes other way around. For the present purpose, and given the meaning of the words, climate can be called subjective and culture objective because a communication culture is often a part of organizational culture which is established by objective measurable routines, habits, and standard operating procedures (SOPs), while a climate is subjective or inter-subjective “feel” or “pulse” of members of a group about the whole group (known triangle between a recognition, an acknowledgment, and an endorsement or opposite).

No matter how objective communication is determined by formal rules, there is always a subjective part of communication which is of the equal importance especially in direct physical verbal face-to-face communication because of the rhetoric reasons mentioned before and the nature of humans. Also, a climate is sometimes the name for an emotional and motivational aspect of communication, while culture is the name of cognitive aspect of it (sent or received). Here various culture differences can create issues and should be taken into account.

Both communication climate and culture can be established or not, even formally or informally, and these can be done in detail but in the same time can be positive and negative. Namely, in a formal group in which a communication culture is very strict and formal, communication climate can be very negative, and other way around, in an informal group in which communication culture doesn't exist at all, a climate can be positive. Strict culture can reduce many negative elements of climate but not all, and a good climate can replace many rules of a culture but again not all, and from time to time, a need for formal rules is obvious.

It is important to mention not just that a communication culture is a part of an organizational culture, i.e., communication procedures are part of all procedures and actions as well as that a communication climate is a part of broader overall climate which covers more than just a communication, i.e., performance, results, effort, etc. given the goals of a group, and this stands for any group from family, friends, or schoolmates to coworkers, people engaged in a group leisure activity, or observing some event (for basics of

communication climate and culture as a part of organizational climate and culture, see Schneider 1990; Trice and Beyer 1993).

Types of Communication Climate and Culture

The channel of communication often determines the ratio between possible positive and negative communication climate. Written communication in formal groups or organizations is often very formalized as well, and there is no much space for creation of negative climate, while verbal communication can create negative as well as positive climate, no matter how formalized it may be.

Some organizations have very strict rules concerning any type of communication, its possible contents, and style, even time of sending a message or reading it. In case of verbal and complicated communication within large groups, all the positive and negative aspects of communication climate and culture can emerge, and such examples typically include crucial decisions and actions of a given group (e.g., long-term decision by a family, group of friends, parliament, or a board of directors of a corporation).

Because of these risks, such types of communication are often regulated by some kind of a strict procedure for discussion, reaching a decision, and implementation. Here communication climate and culture overlap with a decision-making process and steps of this process if set in a strict and efficient way often determine communication climate and culture in such complicated types of communication.

No matter how communication climate and culture can be positive and formally regulated, there are objective obstacles to its effectiveness which are not bypassed by “more emotional positivity” or “more formal regulations,” rather by dealing with technical roots of the problem. Some obvious and typical cases of such obstacles are the following: physical barriers within say working space or between groups of employees, unclear organizational structure (a person isn't clear to whom it should report a problem), barriers

of attitudes (people are refusing to communicate when necessary), linguistic barriers (ambiguity in speech, use of difficult or inappropriate words or phrases), fear of being criticized (one among major reasons for bad communication), etc.

The most prevalent types of communication are verbal and nonverbal. Nonverbal often include facial expressions, gestures, and various symbols and icons combined with written ones, while verbal are further divided into written and oral. Concerning written, there are many formal models of written communication, and they if implemented rarely produce negative communication neither climate nor culture. Negative influence appears in situations in which formal models or channels of communication are used in an informal way or for personal messages (e.g., if formal email is used for gossip).

Opposite to written, verbal oral communication is much loosely formally regulated so it can easily produce either negative or positive influence on communication climate and culture. Individual face-to-face communication can influence climate and culture in specific cases. One is if such communication is between the most responsible decision-makers in a group. Another is if such communication is repeated within group between many members so it can have cumulative effect.

The next level is individual-to-group communication and vice versa which can produce effect on climate and culture in all possibilities, especially if one is presenting something to a group, or if a group is presenting something to an individual (power and influence levels here create numerous possibilities even in formally structured groups). Finally, group-to-group communication (the best examples are various types of negotiations in diplomacy, politics, and business) is often quite chaotic and can produce negative climate and culture if it isn't minimally formalized.

It seems important to notice that reducing negative climate and culture doesn't mean reducing verbal oral face-to-face communication replacing it with say written, because humans are such creatures that need to receive crucial messages orally, verbally, directly, and face-to-face. More to that, negative impact in such situations of reduction means that there is some probability that existent

negativity will simply migrate from oral to written verbal communication channels.

Avoiding Negative and Creating Positive Communication Climate and Culture

On the market, there are hundreds of manuals for effective and positive communication, and most of them have at least one excellent advice which somebody who is on daily basis engaged in communication doesn't know and never applied in an actual communication. Since nowadays we use much more technology, it seems appropriate to advance manuals which, on first sight, repeat what is trivial and obvious concerning these technologies.

In terms of the most often used computer presentations, some obvious advices are not so obvious, like putting a clear contrast between the text or illustration or figure and their background, putting not more than 4–5 lines of remarks and never the whole sentences, concerning pointing it seems obvious to stand to the right of the presentation if one is reading off it since than one can move a hand or a pointer in the direction of the text (in majority of languages from left to right), and finally concerning talking it seems obvious if one doesn't have much time left to cut long story short and to repeat the basics at the end rather than speeding up.

Concerning all the channels of communication and as far as they can produce negative or positive climate and culture simply by being used in an unsuitable manner, it can be said that there is always one general rule. Let us take a conversation as an example. Many experts have described this rule in different ways; however, it seems that P. Grice in his essay "Logic and Conversation" formulated it consistently as his "Cooperative Principle" by saying: "Make your conversational contribution such as is required, at the stage at which it occurs, by the accepted purpose or direction of the talk exchange in which you are engaged" (Grice 1991).

Further on, Grice separated this principle in nine rules which are more than obvious, yet rarely completely followed in a communication practice.

In abbreviated forms, these are the following: “be informative as required, don’t be informative more than needed, don’t say what you believe is false, don’t say what you lack evidence for, avoid obscurity, avoid ambiguity, be brief, be orderly, and be relevant” (Grice 1991). Following this principle and these rules strictly may be not much, but it seems that it can create a good start of forming, maintaining, and improving positive communication climate and culture, and perhaps repeating these rules from time to time can minimize negative climate and culture.

Workplace Communication Climate and Culture

Given the fact that three spheres fill our daily lives, namely, our physical needs (like sleeping, eating, etc.), our work, and our private time, it seems important to apply what is previously said to a workplace. Workplace communication and culture is a part of organizational communication and corporate communication (Shockley-Zalabak 2015).

Since organizational communication is a type of communication within middle or a big group with necessary formal channels of communication and frequent and diverse types of messages, the major issue is how the system is structured or which pattern the system presents. There are various patterns and models of communication, but basically they follow the form of management and governance in the organization. It is quite unlikely that a pyramidal structured organization with strict top-down communication pattern will encourage reverse-pyramid model of work and bottom-up communication pattern.

In short, if one understands the managerial model of a company, one is quite close to its communication model. Many companies have failed because of poor communication systems as a result of poor management system (some speculate that management and communication systems were among major triggers of 2015 “Volkswagen emission case”). There are various patterns or models of organizational communication among which the most frequently mentioned

in literature are chain pattern (pyramid and reverse-pyramid included), circular pattern (wheel included), and star pattern (all-channel network included). Most models follow some previously mentioned basic communication patterns such as Aristotelian persuasion pattern, information model (in various subtypes), or group communication pattern (sociological).

Business communication is a subtype of an organizational communication which covers all organizations. Business communication is specific because the nature of the sector of economy, a particular core business, the market, and the nature of management in a particular company or a corporation can relevantly determine the nature of communication. More to that, every part of a business has its communication aspect, such as production, marketing, management, finance, accounting, etc., and all stakeholders are included, relevantly divided into internal and external in respect to a company (Newman and Ober 2013).

Consequently, basic types of business communication are internal which goes on among company’s internal stakeholders (management, employees, owners, etc.) and external ones (suppliers, market, competitors, buyers, consumers, government, media, local community, etc.). Since majority of external communication of a company eventually goes through marketing department and therefore always is a kind of advertising, an internal communication is what is essential to the company’s core business and basic professions. In this way, internal business communication is closely connected to the technical communication (in which knowledge about processes, products, and similar is needed) and to professional communication (in which know-how of application of professional SOPs to a particular business processes is needed).

Since a business needs to be effective, but not to the cost of quality of a product or a service, fast communication is of essence for its success. Therefore, verbal written and oral communication are reserved for special occasions such as individual relations or crucial managerial decisions, while all other communication is done via other channels such as telephone, video chat, video

conference, online reports, presentations, internal web conferences, workshops, and similar (for practical advices and exercises, see Bennie 2009).

Since these forms are mostly formal, the frequent problem isn't with the communication concerning its content, form, time, or place, rather concerning its direction. Downward or top-bottom communication is regular, but bottom-up or upward is quite rare since employees are quite reluctant to communicate with superiors, especially if they are high in hierarchy.

Therefore, educating in forms of communication and encouraging employees to communicate concerning the core business issues with superiors is of utmost importance, and systems of such communication in a company must be in place and working well, because these communication channels are often the only possible regular media of communication.

Corporate climate and culture immensely define its communication climate and culture, and the most important part of its communication is the one with and between employees that are engaged in its core business and basic professions and workplaces. Here it can be mentioned that Grice saw his "Cooperation principle" as descriptive as well as normative, i.e., as a kind of duty of anybody engaged in a communication.

This is important from a moral and consequently a professional ethical point of view as well, since business ethics, corporate social responsibility (CSR), and sustainability of a good business start at its basic workplaces related to its core business and naturally flows to all other sectors of a company. No matter how a company tries to cover up its flaws in corporate and communication climate and culture, it will, at the end, show that some of basics of human communication applied to a workplace and employees were neglected without obvious reason.

Summary

Communication climate and culture is important for all species which need to communicate so far

as they want to survive, and humans aren't exceptions to this regularity which consequently applies to all human activities that include effective, efficient, good, and decent communication as an essential part of achieving a goal of any activity.

As a part of organizational climate and culture and its managerial pattern and model, communication climate and culture depends a lot on the wider models of governance on the one hand, but it needs to be done properly from the view of human communication as well on the other hand.

Mentioned definitions, models, patterns, etc. apply to all human communication, in private and public life, in any organization, public like governments or ministries, or private like companies of small or medium businesses. There are dozens of historical examples which cannot be mentioned here which show that various social groups, formal organizations, and even companies that were effective, legal, and even fair failed because of their low, poor, or negative group, organizational, or corporate communication climate and culture.

On the one hand, all of previously said can be changed in few decades. Even nowadays we live in a world in which powerful computers are managing powerful robots which are producing not just goods, but services as well. Sooner or later we humans will be communicating with other humans and with robots and computers equally in our private and professional lives.

On the other hand, a communication will always be a communication, but words by being just words are for humans also deeds as Wittgenstein, Austin said, or as Goethe famously claimed "In the beginning was the deed.", or in short as the Old Latin anonymous saying goes "Rem tene, verba sequentur." / "Grasp the subject and the words will follow."

Communication of CSR Information

Natalia Vaz-Ogando
Department of Finance and Accounting,
University of Vigo, Vigo, Spain

Synonyms

Communication of sustainability information;
Disclosure of CSR information; Sustainability reporting

Description

Communication of CSR information emerges from the evolution of the transparency concept at the peak of social responsibility in business management. Traditional financial information for shareholders and investors becomes insufficient to reflect the value of companies and support the decision-making process of a wide range of stakeholders with a growing social awareness. Therefore, the need to create new value metrics arises to cover nonfinancial aspects from an economic, social, and environmental perspective.

Different tools provide information on the sustainable performance of companies. However, sustainability reports are consolidated as the main tool to communicate CSR. Although the implementation of these documents in information systems has been applied on the basis of voluntarism, the newly acquired importance of nonfinancial information encourages regulators to intervene with norms such as Directive 2014/95/EU in the European Union. Also, from a normative standpoint, the Global Reporting Initiative (GRI) plays an important role in the development of sustainability reporting. This institution facilitates transparency and comparability of information by establishing a standardized set of criteria and indicators that adapt to the need for information at each moment. This allows for a more systematic communication between companies and their stakeholders.

Introduction

The new economic and social paradigm in which CSR operates is characterized by the development of a civil society with greater social and environmental awareness. Traditional corporative responsibility evolves from pure economic accountability to shareholders and investors to another one that additionally covers social and environmental issues and addresses a wide range of stakeholders (Fig. 1). Stakeholders expect companies to act responsibly, and they also wish to have knowledge of their activities and their performance in each of the dimensions comprising the CSR. This has triggered a change in the concept of corporate transparency. Social

and environmental information then becomes a significant element in the decision-making process. Under this circumstance, new value or performance metrics, mainly of a nonfinancial nature, attempt to complement traditional financial information to reflect business reality.

Communication on sustainability can be performed in many different ways: information disclosed by the companies themselves or by third parties, in the annual report or by specific reports, externally or internally, with quantitative or qualitative information, and so on (Gray et al. 1995). This practice takes advantage of various initiatives and tools designed around CSR that directly or indirectly provide any information on the sustainable performance of companies. Statements of principles and codes of conduct; guidelines on management systems and certification instruments; professional qualifications; and CSR reporting frameworks are notable among these initiatives.

Statements of principles and codes of conduct are adopted by companies as an internal management tool, but they are also used to make their values and ethical standards visible (see ► “Codes of Good Governance”). The usefulness of these tools will depend on their transparency and credibility. They should therefore be communicated to stakeholders and be controlled by appropriate mechanisms to implement and verify their compliance (European Commission 2004). In this sense, companies can communicate their values and behaviors on issues related to CSR by ratifying such codes and statements, with the possibility of also issuing progress reports on their implementation. The organization itself may develop specific codes of conduct, but international

Communication of CSR Information,

initiatives involving relevant stakeholders may also be present. Examples are the United Nations Global Compact (see ► [“United Nations Global Compact”](#)) or the Guidelines for Multinational Enterprises of the Organization for Economic Co-operation and Development (OECD) (see ► [“OECD Principles of Corporate Governance”](#)).

Regarding guidelines on management systems and certification tools, numerous standards allow organizations to integrate social and environmental considerations in business management (European Commission 2004). For greater credibility, they can sometimes opt for a certification of compliance, a source of reliable information on sustainable company performance. However, most standards cover the dimensions of CSR partially, and they focus on specific aspects, such as SA8000 (see ► [“SA8000 Standard”](#)) and some of the certifications of International Organization for Standardization (ISO) (see ► [“ISO 14000 Standards Series”](#) and ► [“ISO 9000”](#)). Following a more inclusive approach, the ISO26000 proposes a guide to improve existing practices and incorporate CSR criteria in business management. However, this standard contains no requirements for certification (see ► [“ISO 26000 Standard”](#)).

For their part, professional qualifications are a source of information through tools such as lists of socially responsible companies and sustainability indices. Lists of socially responsible companies emerge to identify firms with the best ethical and social practices. When expert ratings on sustainability relate to financial performance, they are called sustainability indices. An example of this is the Dow Jones Sustainability Index (DJSI) (see ► [“Dow Jones Sustainability Index”](#)) or the FTSE4 Good Index. Indices are considered a source of objective and reliable information (Cheung 2011; Christofi et al. 2012; Collison et al. 2008). Even though they make the information available to all stakeholders, these indices are primarily meant for investors given the newly acquired importance of socially responsible investment (Consolandi et al. 2009). Furthermore, they only provide information on large firms given their connection to stock markets.

Finally, CSR information frameworks or structures (see ► [“Reporting Framework”](#)) arise to increase objectivity and comparability in company communication. Unlike financial information, CSR communication involves a great deal of qualitative information, which is difficult to measure. This encourages the development of standards and guidelines to measure, communicate, and evaluate sustainability information. Global Reporting Initiative (GRI) is the most prominent and widely accepted international initiative (Manetti and Becatti 2009; Marimon et al. 2012; Nikolaeva and Bicho 2011). Its purpose is to establish guidelines for companies to provide a balanced and reasonable representation of their sustainability performance. Such initiatives materialize sustainability disclosures through written documents issued by companies to their stakeholders. Public documents providing information on the social, environmental, and economic performance of an organization are known as CSR reports or triple bottom line (TBL), among others. However, the term most commonly used is the sustainability report, popularized by GRI (Amran et al. 2014; Borkowski et al. 2011; Moneva 2007).

Table 1 summarizes the initiatives and tools somehow related to the communication of CSR. Their particular characteristics are identified according to the transmitter, the receiver, and the content of the information emanating from the same.

Sustainability reports may be the most comprehensive tool for communicating a firm's sustainable performance. The information contained in these documents comes from a primary source, the companies themselves. Moreover, information is addressed to all stakeholders and refers to the values, management, and performance of businesses from an economic, social, and environmental perspective.

Evolution in CSR Communication by Companies

Evolution in communicating sustainability has been accompanied by the implementation of

Communication of CSR Information, Table 1 Tools for CSR communication (Source: self-elaborated)

CSR initiative	Communication tool	Transmitter	Main receiver	Information content
Statements of principles and codes of conduct	Codes of Conduct Progress Reports	Company	All stakeholders	Values
Guidelines on management systems and certification instruments	Certifications	External professional	All stakeholders	Management
Professional qualifications	Sustainability lists and indices	External professional	Investors	Performance
Information framework and structures	Sustainability reports	Company	All stakeholders	Values, management, performance

Communication of CSR Information, Fig. 2 Evolution of sustainability information. (Source: self-elaborated)

CSR as a key element in business management. Changes in the social and economic paradigm over the years have caused a shift in corporate communication trends, so that the information adjusts to the needs at each moment and evolves in terms of format and content. Figure 2 shows the most prominent landmarks in the development of sustainability information.

Several authors place the beginning of the development and publication of nonfinancial information in the 1970s (Daub 2007; Manurung and Basuki 2010; Moneva 2005) when concepts such as social accounting and social balance were developed (Gray et al. 1996). At this stage, the financial reports included some aspects of interest to users, such as environmental and labor impacts.

Social accounting was then defined as the process of communicating the social and environmental impact of economic activities of an organization to a particular interest group or society as a whole (Gray et al. 1987). However, this information had little impact then, because the interest on corporate performance was mainly based on the economic aspect and social activities were considered an obstacle for organizations at the time (Moneva 2005). It was not until the late 1980s and early 1990s that nonfinancial information became increasingly important and resulted in the emergence of environmental reports (Daub 2007; Jones III and Jonas 2011; Moneva 2005). A successive series of environmental disasters gave rise to social awareness concerning the environmental

impact of business (Blacconiere and Patten 1994; Moneva 2007; Patten and Nance 1998). This situation is enhanced by greater involvement at the institutional level that highlighted some initiatives of the United Nations like the publication of the Brundtland Report in 1987 and the celebration of the Rio Earth Summit in 1992. This promotes the search for a balance between economic and environmental issues, to benefit both dimensions, thus raising interest in environmental management and communication (Jones III and Jonas 2011; Moneva 2007). Investors start to value this information, and voluntary disclosure becomes a defense mechanism against possible future regulations (Blacconiere and Patten 1994; Patten and Nance 1998). As of the mid-1990s, after the concept of sustainable development is accepted, the content of these reports expands into the social aspects, while economic aspects are reoriented. This leads to the origin of sustainability reports at the end of that decade and its consolidation in business information systems at the beginning of the twenty-first century (Manurung and Basuki 2010; Moneva 2005; Park and Brorson 2005). These documents have a significant potential, as an appropriate vehicle for communicating the nonfinancial performance of organizations, to change the nature of business value measures and provide a balanced assessment of company performance (Hubbard 2011). Given the adaptive nature of sustainability information, a new documentary format called integrated report (see ► “Integrated Reporting for Sustainability”) is developed at the start of the second decade of the century. The integrated report aims to concisely communicate how the strategy of an organization, contemplated from a triple perspective and within the context of its external environment, leads to the creation of value in the short, medium, and long term.

Note that the CSR communication is a largely voluntary practice that companies perform to legitimize their actions to society (Michelon 2011; Robinson et al. 2011). However, the development of the institutional level reflects the importance acquired by this information. Organisms begin to promote policy initiatives that determine formats and contents. Examples

of this are the King Report on Corporate Governance in South Africa (see ► “King III Report and CSR”) and Directive 2014/95/EU of the European Parliament and the European Union Council. The King Code, mandatory for companies listed on the Johannesburg Stock Exchange, requires firms to disclose their sustainability through an integrated report, promoting the proliferation of such documents (Vaz et al. 2016). For its part, the European Directive requires large companies to add a nonfinancial statement within their annual report that includes specific social and environmental information. However, companies are exempt from this obligation when they voluntarily submit sustainability reports that include a minimum content. In both cases, the importance of the GRI Guidelines is highlighted as a framework for the development of information.

GRI and CSR Communication

Sustainability reports are first issued as such in the late twentieth century, and they have gained weight over the years in terms of the number of publications as well as the quantity and quality of information they contain (CorporateRegister.com 2013; Kolk 2008; KPMG 2015). The appearance of this type of document coincides with the issuance of the first GRI’s guide in 1999 (Hahn and Kühnen 2013). This organization has an extensive database containing the reports that have been published following their guidelines since the launch of the first guide. Furthermore, since 2011 the organization also includes other reports not made from their guides to broaden the scope of analysis and to get a general overview about CSR information trends. As seen in Fig. 3, the number of registered documents worldwide totals 12 reports in 1999 to 6.993 in 2016. Although there is an upward trend in all regions, the regions of Europe and Asia especially contribute to this growth (Fig. 4).

The framework established by GRI is currently the most widely used internationally for this purpose (KPMG 2017). This institution was born in 1997 upon the initiative of the US non-

Communication of CSR Information, Fig. 3 Number of sustainability reports registered in GRI database. (Source: Self-elaborated. Compiled from the GRI database (accessed in November 2018))

Communication of CSR Information, Fig. 4 Number of sustainability reports registered on GRI database by region. (Source: Self-elaborated. Compiled from the GRI database (accessed in November 2018))

governmental organization Coalition for Environmentally Responsible Economies (CERES) and the Tellus Institute, with the involvement of the United Nations Environment Program (UNEP) too. Its initial goal was to drive the environmental performance of companies, but it later expanded its scope to also include social and economic dimensions (Jones III and Jonas 2011). Each of the versions of the GRI Guidelines has evolved under a review process that includes institutions,

organizations, and relevant experts in sustainability, based on existing experience and feedback.

The first GRI guide (GRI-G1) appears as a draft on exhibition in 1999. A final version is published in 2000 as the first global framework for sustainability reporting; its review begins immediately and continues for the next 2 years, culminating in the development of a new guide in 2002 (GRI-G2). Later, in 2006, a third version of the guide (GRI-G3) is issued along with a series

of sectoral supplements to suit the specific needs of each industry. The improved third edition version (GRI-G3.1) is published in 2011. It includes a more extensive guide to report on human rights, local community impacts, and gender that shows greater support for social information. After 2 years of work to adapt to new communication trends, such as the integrated reporting, GRI presents its fourth version (GRI-G4) in the year 2013. This new version implements changes and developments that attempt to focus on the material aspects of CSR of each company to reach more strategic and credible reports. Finally, the GRI launches the first comprehensive standards for sustainability reporting (GRI Standards) in 2016 that include the main concepts of the previous version with a more flexible modular structure, some clearer requirements, and simpler language. GRI Standards is effective for reports published from July 2018 and can be used by companies of any size, industry, or geographic location. Figure 5 shows how companies that publish GRI reports according to database records already suit each of the guide versions from the

year in which they are issued. It also reflects that different versions can coexist in the same year during the transition stage.

The GRI is therefore a dynamic initiative that continually evolves and adapts its guidelines for companies to provide quality information based on needs arising at all times. Each version implies a greater commitment and participation of stakeholders, the search for a greater ease of use by information issuers and users, the harmonization with other initiatives, and the strengthening of information reliability. In this adaptive and harmonizing facet, it is noteworthy to point out that GRI, together with the Prince of Wales' Accounting for Sustainability Project, formed the International Integrated Reporting Council (IIRC) in 2010, which advocates the implementation of an integrated report. This concept, which includes the idea of strategic integration of information, has been increasingly accepted over recent years (Ballou et al. 2012; Eccles and Krzus 2010; Frias-Aceituno et al. 2014; Sierra-García et al. 2015; Veltri and Nardo 2013). The report published by KPMG (2013) evidences an

Communication of CSR Information, Fig. 5 GRI Guidelines implementation in reporting practices. (Source: Self-made, Compiled from the GRI's database (date accessed November 2018))

increase in the publication of CSR information integrated in annual reports. However, only 10% of companies belonging to the N100 index (made up of the 100 largest companies in 41 countries) state having an integrated report. Following the information extracted from the GRI database, the number of registered integrated reports declined from 15% in 2011 to 8% in 2016. Furthermore, it is still an ambiguous concept that has given rise to different information structures, ranging from the communication of unconnected information to the creation of a more sophisticated structure that provides interrelated financial and nonfinancial information. Therefore, sustainability reports remain as the most widely used tool for CSR communication.

Summary

CSR is configured as a strategic element integrated in business management consequent to the evolution of corporate responsibility in society. Organizations must not only act from a socially responsible perspective, but they should also declare their commitment and performance so that it can be internally or externally communicated. Therefore, corporate sustainability must be defined, measured, and communicated to become a source of value creation.

Several tools can be used to report on the sustainable performance of companies, whether it is directly or indirectly, as a whole or partially, and so on. Nevertheless, sustainability reports are configured as the main instrument used to disseminate business practices in CSR matters. Often accompanying financial reports, sustainability reports symbolize a growing demand for greater transparency from stakeholders. These documents reflect the image of companies from a holistic perspective that encompasses economic, social, and environmental dimensions, to generate a valuable source of information for the new paradigm of decision-making beyond mere financial performance.

Communication of CSR should be understood as a dynamic and evolving practice that serves the information needs of stakeholders.

Although the origin of nonfinancial information dates back to earlier decades, its importance as a key element for decision-making is consolidated in the twenty-first century. The increasingly voluntary disclosure through the publication of sustainability reports confirms its importance. Furthermore several new regulatory initiatives make the disclosure of nonfinancial information mandatory for certain companies over the last decade. This reflects the need for this type of information and traditional financial reporting to be similarly considered in assessing business performance.

The mainly qualitative nature of nonfinancial information, its contextualization, and the variety of its users hinder the implementation of communication processes with the same rigor and regulation of financial information. In this sense, information frameworks are of great importance in developing and improving sustainability reporting, promoting comparability, and evaluating reports contents. Specifically, the guidelines issued by GRI have a significant potential to improve the usefulness and quality of information on sustainable impacts and performance. They quickly adjust to changing business transparency from an integrative and multi-stakeholder perspective. This is why their actions may be decisive in the development of CSR communication. In fact their standards enjoy great international recognition, both at the firm and the institutional level.

Definition

“We all belong to communities of practice... in fact communities of practice are everywhere” (Wenger 1998, p. 6). A Community of Practice (CoP) is a group of people who share similar challenges, interact regularly, learn from and with each other, and improve their ability to address their challenges. The theory of CoP starts from the idea of situated learning and learning by interaction and studies how a CoP generates and diffuses knowledge among members and in the organization in which the CoP arises and grows. In this chapter, CoP is described, taking into consideration components, characteristics, relationships among members in the CoP and between the CoP and organizations, benefits and limitations in activating a CoP, and factors that enable or obstacle the success of a CoP. It emerges that CoP exist in many contexts and that the presence of interorganizational CoP is growing, as well as the diffusion of virtual CoP. Moreover, CoP must pay attention to the search for an equilibrium between formal-informal functioning, control-autonomy, and core group-peripheral members.

Recently, CoP has manifested an interesting role in two key issues: innovation and sustainability. Some experiences show the conditions under which a CoP can be a center of innovation production, both incremental and radical. The lens of the theory of CoP seems to be very useful when communities face the challenge of sustainability. It represents a very promising area in which research and practice dialogue in search of the best solutions to environmental issues.

Introduction

Intellectual capital and social capital are among the most relevant resources in a firm. In the literature, there are many definitions of intellectual capital. Marr et al. (2004, p. 554) report several definitions of intellectual capital and propose their own: “(Intellectual capital) ... is composed of all knowledge-based assets, distinguished between organizational actors (relationships, HR) and infrastructure (virtual and physical).” OECD

(2001, p. 41) defines social capital as “networks together with shared norms, values and understandings that facilitate co-operation within or among groups.”

Roots of both intellectual capital and social capital are knowledge and know-how. Thus, research of the social and organizational conditions favorable to creation and diffusion of knowledge inside the firm and among economic actors is imperative. In every organization, private or public, effective and efficient knowledge management supports the creation of innovation and the goal of competitive advantage. Over time, the role of knowledge management manifested in essentially three phases (Snowden 2002), related to the increasing consciousness of the strategic meaning of knowledge.

Initially, knowledge management was neglected, because the focus was on business process reengineering interventions. As an organization needs more information in order to make decisions and formulate strategies, rethinking information flows is an unavoidable issue in the firm. The value of knowledge gained through experience was not part of this discussion.

In the second phase, firms realized the crucial necessity to transform individual knowledge into organizational knowledge. However, it soon became clear that this transformation was not driven only by an information flow. It required a socio-relational component essential to spread knowledge. Moreover, the concept of knowledge itself has a tacit and an explicit component, making the diffusion of knowledge difficult.

This leads to the third phase, in which knowledge management means to build, maintain, and nurture conditions to create and disseminate knowledge through social relationships.

In general, individual knowledge could be explicit, that is, easy to share with other people, or tacit, that is, personal knowledge that is not visible to others. As has been indicated, it is crucial to transform knowledge from individual to organizational knowledge. Nonaka and Takeuchi (1995) described a model of knowledge conversion: the SECI model. These authors argued that, in organizations, knowledge is created, transferred, and regenerated through four phases:

Community of Practices,
Fig. 1 Four modes of
knowledge conversion
(Nonaka and Takeuchi
1995, p. 62)

socialization, externalization, combination, and internalization (Fig. 1).

Socialization (from tacit knowledge to tacit knowledge) occurs when an individual is willing to share knowledge with other people. It is the process of sharing tacit knowledge through observation, imitation, practice, and participation in formal or informal communities. Externalization (from tacit knowledge to explicit knowledge) is the process of expressing tacit knowledge in explicit concepts, thereby transforming tacit knowledge into explicit knowledge available to the organization. Combination (from explicit knowledge to explicit knowledge) is the process of integrating concepts into a knowledge system. Internalization (from explicit knowledge to tacit knowledge) is the process of embodying explicit knowledge into tacit knowledge. The individual makes new knowledge coherent to his/her identity and enhances knowledge through a learning process.

In this broad context, Community of Practice (CoP) was born and developed (Choi 2006).

Community of Practice

As described, the creation and diffusion of knowledge is possible only if there are places, physical or virtual, where tacit knowledge is shared. Many social structures play a relevant role in sharing knowledge, for example, project teams, formal work groups, or networks (Wenger and Snyder 2000; Kerno 2008). Lave and Wenger introduced the CoP in 1991 and extended the concept in 1998

(Cox 2005). In describing situated learning, they considered CoP as a different social structure that brought together the ideas of community and practice.

A CoP is a group of practitioners who share similar challenges, interact regularly, learn from and with each other, and improve their ability to address their challenges.

Another interesting definition (Lave and Wenger 1991, p. 98) gives evidence to the strong relation between CoP and knowledge management: “(a CoP) is a set of relations among persons, activity and the world, over time and in relation with other tangential and overlapping communities of practice. A community of practice is an intrinsic condition for the existence of knowledge, not least because it provides the interpretative support necessary for making sense of its heritage”.

The CoP find its roots in a social theory of learning and in the idea of learning by interacting, emphasizing the relevance of “interaction” between individuals in creating knowledge. The social theory of learning includes four essential elements (Wenger 1998): (i) meaning, (ii) practice, (iii) community, and (iv) identity (Fig. 2).

First, “meaning” indicates the ability to interact with reality and the world and to attribute meaning to lived experiences which are shared in the community. Members, in becoming part of the CoP, have shared interests and the same understanding of what is important to individuals and to society.

Second, “practice” indicates the schemes, frameworks, and perspectives derived from

Community of Practices,

Fig. 2 Components of a social theory of learning (Wenger 1998, p. 5)

experience that originates in the community. In other words, practice implies knowledge in action (Mohajan 2017).

Third, the “community” is the structure in which activities have a specific meaning to the members of the group.

Finally, identity implies that learning changes who we are.

Some characteristics of the CoP help to distinguish it from other social structures related to knowledge. In a CoP, membership derives from a self-selection based on interest, passion, common challenges, etc. As a result, the community could be physically distant. In addition, boundaries are fuzzy, as a CoP can change over time in terms of members and goals. In fact, usually a CoP originates with a core group of members, then, progressively, younger and less expert members join. New members are initially in a peripheral position but gradually gain legitimization through interaction with older and more expert members. This process is complex and implies an evolution from peripheral to core membership through several phases (Borzillo et al. 2011). In this sense, newer members move to the center of the CoP, while other members gradually leave. Finally, as a CoP is not formally determined, trust between members is crucial to sustain the structure.

According to Wenger (1998), a CoP has three distinguishing factors (Fig. 3):

- Joint enterprise: members recognize a common goal of the community and work together in pursuing it (what the CoP is about).
- Mutual engagement: members deliberately interact with others in the community and have a strict relationship with the community (how the CoP functions).
- Shared repertoire: members create common resources and practices. This process is possible thanks to mutual engagement and the sharing of experiences and activities that lead to practices which have a common and shared meaning in the community. It means that the community has common languages, meanings, routines, and experience, even if they continuously change over time (what capabilities the CoP has produced).

Key Issues

After its conceptualization, CoP became very popular and the literature acknowledged that CoP is present in many organizations. CoP can be found in private and public sectors and in very different organizations, but results are not positive in every context or firm. Consequently, many authors investigate the benefits and limitations of a CoP. Wenger (1998) underlined that CoP contribute to organizational learning potential in two ways: they develop knowledge at their core; and they develop knowledge through interactions at

Community of Practices,

Fig. 3 Dimensions of practice as the property of a community (Wenger 1998, p. 73)

their boundaries. In fact, CoP is a node for interpretation and exchange of information in which knowledge is produced in “living ways” and diffused throughout the whole organization. Bringing some experience from business cases, Wenger and Snyder (2000) argued that CoP:

- Help drive strategy because they support the firm in finding out key issues or topics that could be relevant in defining and implementing strategies.
- Start new lines of business because CoP generate incremental innovation as well as radical innovation, helping the firm to find new market opportunities (Borzillo and Kaminska-Labbè 2011).
- Solve problems quickly, because they help to locate members that face the same problems and can assist in finding solutions. Thanks to the informality of CoP, contact and dialogue is easier than in other forms of cooperation.
- Transfer best practices because they are an ideal forum where ideas are shared and best practices emerge and then are spread into the organization.
- Develop professional skills as the dynamics of a CoP allow younger members to learn from senior members. Moreover, the movement of members from peripheral to the center helps in sharing knowledge.
- Help companies recruit and retain talent because people find in the CoP the opportunity to express themselves, cultivating ideas

and projects and giving value to their roles. Moreover, in generating knowledge, CoP renew people skills and the organization itself.

Dalkir (2005) emphasized that CoP improve efficiency of processes, generate greater and growing revenue, and provide support in building loyalty and commitment among stakeholders.

CoP also have some limitations and weaknesses. Roberts (2006) underlined how power inside the CoP can shape the meanings and the direction of the CoP and how it can reduce creativity and the emergence of new and different perspectives. Even if the CoP is a flat structure, this problem can be more intense when CoP members belong to different levels in the hierarchy of the organization. The language or code that a CoP uses could be too restricted and limit learning and knowledge creation. In addition, the sociocultural environment in which the community lives can be a limitation, depending on the culture in the organization and in the region. For example, Kerno (2008) suggested that Western societies are likely to be less successful than their Eastern counterparts, due to the different cultures.

Other, more practical, obstacles are related (Kerno 2008) to the limited availability of time (time crunch). To be effective, a CoP needs a time-dedicated activity. As CoP are established in organizations, a strong hierarchical structure may tend to limit creativity and define too strictly the borders of the activities of the CoP.

Community of Practices,
Fig. 4 Factors of success
 and failure of CoP

Several authors have focused attention on factors that can positively or negatively affect the life and the results of CoP. In general, five areas are relevant in the success or failure of a CoP (Fig. 4).

A review of these contributions is reported in Table 1 which shows the most critical areas, deriving from the characteristics and elements of CoP.

The “clear definition of goals” is a prerequisite to CoP establishment and is at the basis of the joint enterprise, defined by Wenger. When goals are too generic, CoP have a high probability of failure. One problem can be practice intangibility (Probst and Borzillo 2008, p. 343) that occurs “when members fail to engage with one another in a way that allows them to illustrate the practice to make it concrete enough for other members to understand and visualize its function.” As a CoP doesn’t live in a vacuum, the goals of a CoP need to be coherent with an organization’s strategy to be effective in their context. When a CoP affords very complex topics, it is very useful to split the fundamental goal into sub-topics or problems that can be studied and solved separately in an easier way.

A CoP works if its members have the right competencies and an attitude of interaction. Experience gives evidence to the fact that CoP with very specialized members as well as CoP with diverse competencies can be successful, depending on the topic and the challenges they face. Interactions derive from mutual trust between members and the motivation of individuals. The presence of an environment that favors cooperation helps a CoP to express creativity. Pyrko et al. (2017, p. 394) speak of “thinking

together as a form of sharing tacit knowledge under non-routine problematic circumstances.” Schofield et al. (2018) advised to be alert regarding lack of a genuine interest to participate (Machiavellian participation). In contrast, if competencies are too rigid, interaction is low, the environment is very competitive, and a strong hierarchy is predominant, then a CoP will find it difficult to grow and to achieve good results in terms of knowledge and innovation.

The issue of governance is very crucial because the theory of CoP argues that they are spontaneous and informal, but empiric observation shows that CoP have some rules and mechanisms of functioning. Various authors underline how important it is to have a central nucleus in which members act as stimuli inside the CoP. The presence of a leader and a sponsor helps to keep all members focused on the challenge they are facing, and a governance committee helps in working on sub-goals and in integrating results. As a CoP is part of an organization (Bardon and Borzillo 2016), good governance mechanisms support the autonomy of the CoP while allowing the diffusion of knowledge within the firm. The balance of control and autonomy is one key question in the relationship between a CoP and the organization. Many CoP are interorganizational, and this increases the necessity of mechanisms that will canalize, in some way, the informal and innovative energy of the CoP in producing knowledge that can be used efficiently in the organizations involved. As Borzillo and Kaninska-Labbè (2011, p. 29) suggested, “CoP transcend the rigidity of organizational boundaries and hierarchies

Community of Practices, Table 1 Success and failure factors in a CoP (re-elaborated version of Cattaneo et al. 2018)

Success factors	Failure factors
<i>Clear definition of goals</i>	
Joint enterprise (Wenger 1998)	Practice intangibility (Probst and Borzillo 2008)
Stick to strategic objectives (Probst and Borzillo 2008)	
Divide objectives into sub-topics (Probst and Borzillo 2008)	
<i>Personal skill and interaction between members</i>	
Mutual engagement (Wenger 1998) and active participation (Davenport and Hall 2002)	Low level of one-to-one interaction between members (Probst and Borzillo 2008)
Shared practice or shared repertoire (Wenger 1998)	Rigidity of competences (Probst and Borzillo 2008)
	Lack of identification with the CoP (Probst and Borzillo 2008)
Cooperative environment (Kerno 2008)	Competitive and individualist environment (Kerno 2008)
	Hierarchical structure (Roberts 2006; Kerno 2008)
Genuine interest to participate (Schofield et al. 2018)	Machiavellian participation (Schofield et al. 2018)
<i>Governance</i>	
Form one or more governance committees (Probst and Borzillo 2008)	Lack of a core group, taking an active part in the CoP (Probst and Borzillo 2008)
Identify CoP leader and sponsor (Probst and Borzillo 2008)	
Overcome hierarchy-related pressures (Probst and Borzillo 2008)	
Establish a form of recognition of the participation of individuals (Mohajan 2017)	
<i>Tools and processes</i>	
Tension between formal and informal Intervention of management in the management of the CoP (Bardon and Borzillo 2016; Borzillo et al. 2011; Borzillo and Kaminska-Labbè 2011)	
Feed the CoP with external expertise (Probst and Borzillo 2008)	Be self-referential and isolated from the organization (Pattinson et al. 2016)
Promote the access to other intra- and interorganizational networks (Probst and Borzillo 2008)	
<i>Accountability</i>	
Provide measurable performance (Probst and Borzillo 2008)	
Share and discuss the results (Probst and Borzillo 2008)	Keep results only inside the CoP (Pattinson et al. 2016)
Appreciation, across organization, of the result of CoP (Wenger and Snyder 2000)	

without destabilizing the formal organizational structure.”

Related to the governance mechanisms is the issue of “tools and processes.” Many authors underline that a CoP must be “managed” or “cultivated”; that is, it must search for an equilibrium between formal and informal. In this regard, managers of the organization must support the CoP by legitimizing it and creating the best conditions for people who are part of the CoP. They must favor the diffusion of the results of the CoP within the

organization as well as in other organizations who take part in the CoP. In other words, organizations (and managers in particular) are fundamental in nurturing a CoP. In fact, their mediation role between CoP and organizations, and their support in finding out relevant challenges, can “translate” the output of the CoP into practices that become part of the routine in the organization.

Some tools are very important in facilitating the work in a CoP because a CoP can be located in a physical place or, more frequently, a distributed

or virtual one. The establishment of an online CoP creates an opportunity to involve many individuals who are sometimes dispersed all over the world but are interested in the same topic or are facing similar challenges. Even in a virtual CoP, communication systems and technology are essential; they are important in every CoP because they increase the sharing of information and experience, the formalization of the shared repertoire, and provide a means to transfer knowledge across the boundaries of the community.

Finally, the results of CoP must be measurable, that is, the CoP itself must be accountable. It is important to make visible the practices or innovations that emerge from the work of the CoP, as well as to give evidence as to how they can improve efficiency and efficacy in the organization. Managers are important in giving value to the output of the CoP, but this is possible only if the CoP has some measurement tools. Even if knowledge and innovation are intangible and difficult to measure, a CoP that makes visible its contribution to continuous improvement (or, sometimes, to disruptive innovation) will gain legitimization in the organization.

Future Directions

Despite some limitations and barriers, CoP are considered a very useful structure in the generation and diffusion of knowledge. Some future directions of research emerge.

A first stream of research is related to innovation. Currently, many authors have extended the CoP perspective, studying CoP not only as a center of exchange and diffusion of knowledge but also as a center of production innovation. Borzillo and Kaminska-Labbè (2011) investigated how a CoP can contribute to incremental innovation as well as to radical innovation. Specifically, they observed that managerial involvement can create a virtuous circle of innovation. In a first phase, managers are in “step-in mode”; that is, they are a sponsor of the CoP and support it in making clear the goals of the CoP and the way it works. This phase leads to an expansion of knowledge and to incremental innovation; that is, to recombining

knowledge to improve existing product offerings. In a second phase, managers are in “step-out mode” and voluntarily withdraw from their community. The new free and unstructured flow of ideas that results allows a knowledge probing that leads to radical innovation from a recombining of knowledge to generate radically new product offerings.

More recently, Pattinson et al. (2016) built a framework for constructing communities of innovation and showed how CoP can act as enablers or constrainers of innovation (Fig. 5).

As the figure shows, a closed and too structured CoP results in a constraint to innovation, while a more collaborative and open structure enables innovation. Trust, reciprocity, and social capital lies in the center of the CoP. If they receive the right support, both intra- and interorganizational CoP can enhance innovative capabilities and originate innovation (incremental and radical).

The interorganizational CoP area is growing in relevance. These CoP face challenges that involve several organizations and, almost more frequently, communities and society. Dunham et al. (2006) discussed the notion of “community” and the role of “community” in stakeholder theory. They described CoP as an emerging subcategory of community that, similarly to Virtual Advocacy Groups, has not received much consideration in stakeholder theory but are increasingly significant. Referring to CoP, the authors (pp. 35–36) argued that: “the challenge for stakeholder managers here is to identify the various CoP that operate within their organizations, or that link their organizations with outside constituencies, and then support those communities. . . .support those actions and policies committed to preserving, supporting and enriching the development of each individual’s uniqueness within the context of community, rather than subordinating the individual in the name of community building.”

A second relevant stream of development is sustainability. Some authors have observed, using the lens of CoP theory, several cases of CoP in the area of community sustainability, often in creating a bridge between science,

Community of Practices, Fig. 5 Communities of practice as enablers and constrainers of innovation (Pattinson et al. 2016, p. 511)

practice, and politics. For example, Gonzalez et al. (2011) showed a CoP involving five European cities and engaging researchers and practitioners. The goal of the CoP was to develop common urban sustainability indicators and to consider city specific aspects as well. The authors highlighted some limitations of the observed CoP to be the influence of some actors in defining indicators, the fact that the interests of stakeholders did not always merge with the project objectives and the time constraints. On the other hand, the project increased collaboration and enhanced capabilities of participants and of the city involved.

Armanios (2012) studied 23 Egyptian rural water projects and, integrating the CoP framework with a capabilities approach, described a matrix considering local/external definitions of project goals and local/external implementations of the project. It led to four possible scenarios and to an evaluation of their economic, environmental, and engineering sustainability.

Iyalomhe et al. (2013) described two cases regarding projects of climate change adaptation. In these contexts, researchers, experts, policy-makers, and stakeholders worked together in a CoP and defined ways of practice in these projects. It created a virtuous circle of knowledge and led to efficiency and efficacy of the project.

Bradbury and Middlemiss (2015) showed how learning in a CoP supported a grassroots association (Green Action) and sustained and renewed it in the long term. Green Action is a student society that introduced a recycling scheme and time, runs a food cooperative, and offers skill-share workshops. The authors recognized in the CoP the component and characteristics described by the theory of CoP and concluded that the learning process allowed Green Action to be active for more than 20 years despite the turnover in student population.

These experiences give evidence to the fact that CoP can contribute to transform principles and goals of sustainability in projects, practices, and routines.

Summary

CoP have probably always existed as a spontaneous aggregation of people that, in sharing their experiences and knowledge, find more efficient solutions for common problems. However, positioning CoP in relation to knowledge management, social capital, and intellectual capital shifts attention to the potential of CoP in creating and spreading knowledge. The theory of CoP has received much attention from researchers as well as practitioners. Many issues are relevant in making a CoP a success or a failure, and they regard the composition and the dynamic relations between members who are part of the CoP. The relation between a CoP and the organization to which it belongs is also very important. Complexity will increase in cases of interorganizational CoP or virtual CoP, in which the issue of technology and instruments of sharing become crucial.

New directions in studies and experiences are more focused on CoP as a place of innovation (incremental and radical) and on the topic of sustainability, as the CoP could be a place of dialogue between researchers, experts, decision makers, and various stakeholders.

Definition

Sustainability has become a central concern in communities around the world. However, there have been limited attempts to define sustainability at community level. It is widely argued that sustainable communities are the ones that follow ecological, social, and economic aspirations and aspects of sustainable development. Accordingly, community sustainability can be defined as the total of community-based attempts to preserve a strong and successful economy, society, and environment; to adjust and respond to outside challenges and opportunities; and to provide quality of life for members in a persistent way (MacKendrick and Parkins 2004). In a more recent and comprehensive definition, Mischen and her colleagues (2019) describe community sustainability as sharing of collective resources by functionally and socially connected actors in “a way that engages members in a set of governance processes resulting in an equitable access to health, educational, and economic well-being while not disturbing future generations’ or other communities’ rights on these resources” (p. 10). Sustainable communities continue to develop sustainably, where this development is achieved as a fundamental part of the environment without harming it, and allows equal distribution of resources and opportunities among its members both today and in the future (Winther 2017). Sustainable communities have the power, agency, organization, and capability to realize sustainable development and change.

Introduction

Understanding sustainable development at broader levels such as national and global necessitates first examining and measuring it at community-level. Communities have two essential attributes related to sustainability. Community refers to a particular geographic area where people are linked to one another. That is, people live, work, and obtain key resources (e.g., water, gas, and electricity) and services (e.g., health care, education) within a community (Mischen et al. 2019). Additionally, the boundaries of a community are determined by its functional and social relationships as opposed to mere geographical proximity (Callaghan and Colton 2008). These boundaries may shift according to the underlying issue and time. Spatially, communities comprise neighborhoods or municipalities, whether rural or urban. Functionally, they stand on a rich and complex network of actors that bring resources, capacity, coordination, governance, and other essential components to a community (Mischen et al. 2019). The complex interactions in a community at micro and macro levels constantly change across time and space (Winther 2017), which represents a dynamic, ongoing process produced and shaped by the action of multiple actors.

Community sustainability consists of a set of tangible and intangible elements, representing different elements of sustainability. The most important ones include sustainable production and consumption, job creation, transport and connectivity, infrastructure, health, aging and well-being, ecology, education, housing, energy use, cultural and social activities, and tourism (e.g., MacKendrick and Parkins 2004; Farmer et al. 2012; Winther 2017). All of these aspects at community level are characterized by different goals, indicators, and measures. In communities, a number of subsystems are placed within larger systems and these subsystems are presented by different stakeholders such as governors, local businesses, healthcare service providers, and schools. Still, these elements are interconnected and complementary to one another.

Within this integrated system, sustainability of communities rely on fostering social equity, creating and maintaining economic and environmental health, and motivating community members' participation in planning and implementation of common issues (Middlemiss 2011). The success of community sustainability initiatives is largely determined by the involvement of members in sustainability principles and collective vision for future and the integration of economic, environmental, and social goals (Ling et al. 2009). The next three sections outline the key concepts and frameworks regarding community sustainability: community capitals framework, community resilience, and community sustainability planning (CSP), followed with a discussion of how community sustainability can be measured through selected indicators.

Community Capitals Framework

Community capitals framework is one of the essential models to explain community sustainability. It proposes that communities have a set of different types of capitals that flow and interact, and sustainability of a community depends on the development of these capitals (Robinson and Carson 2016; MacKendrick and Parkins 2004). They represent various types of resources, which diverse community stakeholders rely on and contribute into (Callaghan and Colton 2008), and in turn, these resources and their interactions are supposed to determine sustainability of a community. While Bourdieu (1986) initially established economic, social, and cultural capital as the fundamental forms of capital, new categories have been added by different researchers including natural, human, financial, infrastructure, and political capital.

Natural (environmental) capital consists of the ecological resources and all earth systems such as air, sun, water, soil, wildlife, and biodiversity, climatic factors like greenhouse emissions, which provide both possibilities and limits to human action (MacKendrick and Parkins 2004). Economic capital reflects the allocation decisions

of monetary and other economic resources that can be categorized into two types: financial and infrastructure capital (Callaghan and Colton 2008). Financial capital represents the money available to use in community capacity-building and future community development provided by individuals' wages, loans, and investments whereas infrastructure capital entails human-made structures and institutions like water and sewer systems, transportation, housing, information and communication systems, parks, and libraries (Flint 2010). The private sector along with the public sector may also contribute to building it. Besides financial and infrastructure capital, commercial capital may also be considered as a component of economic capital, available to only those who enter into a commercial transaction or agreement.

As another community capital type, human capital reflects the characteristics, abilities, knowledge, skills, and potential of individuals gained from birth or developed through education. Altogether, it reflects the capacity of persons to contribute to community through production, innovation, leadership, and decision-making (MacKendrick and Parkins 2004). What skills and knowledge are most essential depends on the specific context and future aspirations of the community. Social capital describes the nature and ways of interaction among people built around solidarity, mutuality, collective identity, and sense of a common future (Dale and Newman 2008; Robinson and Carson 2016). The amount and quality of relationships facilitate productive activities in the community. However, it can only exist through human interaction. Cultural capital entails the values, beliefs, symbols, and world views that we give importance and usually takes for granted such as language, history, art, customs, artifacts, sense of place and time, and the ways of acting (Callaghan and Colton 2008). Both tangible and intangible cultural heritage are largely manifested in the structure of the community. Finally, political and public capital can be added to the above. Political capital indicated the power to influence certain standards and rules and the application of them regarding resource use and distribution.

It is very difficult to say if one of these capitals is superior to or more relevant than the others. However, some of them may provide the necessary foundation to the others (Flint 2010). Finding the right balance among different capital forms is needed yet difficult. The connections among them are often deep and subtle, thus cannot be easily detected. Moreover the balance among them will change over time. As community stakeholders have different needs, concerns, and interests, they give different levels of value to each capital domain (Robinson and Carson 2016).

Community capital framework has become a very useful model for developing the necessary tools to measure different aspects of community as well as their aggregation (MacKendrick and Parkins 2004). It could also be used to model the changes in any of the capital types and relative performance compared to other communities (Callaghan and Colton 2008). The link between the levels of available capital and different community outcomes can also be assessed. This assessment helps to identify the existing problems and risks so that proper policies can be developed for addressing them.

Community Resilience

Recently, community sustainability has been increasingly discussed in relationship to the notion of community resilience, and in many occasions, sustainability and resilience are used interchangeably (Callaghan and Colton 2008; Robinson and Carson 2016). While there are essential connections and similarities between community sustainability and resilience, the two concepts have distinct meanings and roles. Resilience in human communities represents the collective capability to adjust to and influence change. Then, a resilient community is the one that has the capacity to react to economic, social, and ecological crisis (Lew et al. 2016). Besides sustaining the community, collective capacity is used to renew it and develop new paths for its future (Winther 2017). Elements for developing community resilience include planning and

developing strategies to reduce vulnerabilities, developing crisis management systems, creating risk minimization and diversification programs (Franklin et al. 2011).

Community resilience and community sustainability both assume the congruence between society and environment, mutually focus on ecological systems and community development, and have the shared ultimate goal of community survival and well-being. Yet they also differ in several aspects. Sustainability seeks stability, balance, and preservation whereas resilience emphasizes dealing with and managing unpredictable change, vulnerability, flexibility, and crisis (Lew et al. 2016). Based on the goals of the particular community, one might prevail over the other. However, they can also be used together as complementary perspectives for necessary yet nuanced objectives of the same community (Flint 2010). For example, when evaluating a community project, its contribution to sustainable development might be supported with the question of whether it also creates a more resilient environment, society, and economy. In a way, enhanced community resilience may ultimately push a community toward sustainability.

Community Sustainability Planning

In order to develop a resilient community with necessary capitals, careful plans should be made and implemented. CSP can be described as a long-standing plan developed by the participation of community stakeholders that provides the course to community sustainability goals and implications regarding economic, social, and environmental pillars (Park et al. 2009). The need for CSP emerges from the fact that sustainability cannot be achieved through individual and isolated actions in different sectors. Such plans aim to create an agenda for action on a wide array of sustainability goals. CSP provides an integrated approach that produces multiple impacts and larger benefits for the community. Sustainability planning brings about a comprehensive understanding for managing resources efficiently,

bridging local and broader decision making, and engaging in long-term thinking.

CSPs typically define specific objectives and aims for environmental, sociocultural, economic, and governance domains of sustainability. There might be collaborative or stand-alone CSPs. Integrated CSPs require collaboration between different levels of government and across private-public sectors, so that new approaches, technologies, and governance systems can be implemented (Ling et al. 2009).

There is no single way of developing a CSP and each community may treat it differently. Yet, there are some common principles that should be followed (e.g., MacDonald et al. 2019; Park et al. 2009). First, good CSP is about the process, not only outcomes. Strong leaders and participants who have a good understanding of what sustainability is are required to initiate such plans. Similarly, without a strong, shared vision of what community wants, a good plan cannot be articulated. The sustainability gap should also be clearly identified. That is, the gap between what has already been done and what is desired in the future should be clear. The collaboration among different actors both individual and organizational should be built. Last, the advancement and progress of sustainability plans should be carefully followed and measured.

CSPs are conducted through a number of steps (Park et al. 2009; Ling et al. 2009). According to Park and his colleagues (2009), in phase 1, an invitation is made to relevant community stakeholders and leaders who will engage in conversations and discussions regarding the future of the community. In phase 2, the planning process is structured. That is, the specific approach to be followed and the roles and responsibilities of contributors are determined. Phase 3 entails building of a community vision and a shared understanding of success, and a shared intention for sustainable development is generated. In phase 4, the specific community systems for achieving sustainability are determined. It necessitates identifying these systems, clarifying the process and deliverables, and selecting sustainability indicators. In phase 5, initiatives and investments are prioritized based on strategic goals. Finally, in phase 6 the progress

on the implementation of the CSP is monitored and evaluated.

Another CSP template introduced by Ling et al. (2009) argues that a community sustainability plan can be developed through four key steps: engagement, understanding community space, establishing the plan, and executing the strategy. Engaging the community entails determining who the locals are, establishing the principles of engagement, giving members actual influence in decision-making, and learning from others' experiences. Understanding space is about mapping the community with respect to the allocation of ecological, social, and economic opportunities and services, so that problems in accessing resources, places, and information can be resolved. After this mapping, the plan can be created, in which the community vision, goals, and principles are defined, and a long-term view is linked to shorter terms goals. Such adaptive timeframe can support better responses to uncertainty, changing environmental limits and newly emerge community desires and knowledge.

The scale of CSP should cover different groups in community population and be broad enough to examine intrinsically connected community services as well as the infrastructure needed to sustain them. Moreover, institutional needs and strategic areas are identified, commitments are determined, and progress is monitored and measured against measured desired outcomes. In the final stage of implementation, a review is undertaken to identify problems in principle and in action that may hinder sustainability planning. Legally enforceable and accountable plans should be developed. Finally, the plan implementation should be supported by knowledge and information disseminated.

A number of CSP implementation examples have also been examined in the literature such as the CSP initiative for conserving and developing tropical landscapes in tropical communities (Reed et al. 2019) and the integrated CSP developed in Atlantic Canada municipalities (Grant et al. 2018). These examples indicate that complex community problems regarding environmental,

social, cultural, and economic issues can be effectively addressed through CSP with the involvement of diverse stakeholders across different sectors. Even though implementation and operationalization challenges exist, aligning the planning policy appears to bring several advantages to communities for developing long-term comprehensive outcomes.

Indicators of Community Sustainability

To meaningfully understand and compare communities for sustainability, specific indicators, metrics, and indices have been developed, enabling the identification of community strengths and weaknesses regarding sustainability (e.g., Turcu 2013; Lew et al. 2016). In turn, the findings from such measurements shape the policies and practices which will lead to higher levels of community sustainability (Mischen et al. 2019). On the other hand, sustainability assessment systems adopted at the community level might have certain problems and limitations including ambiguous definition of community sustainability, scale issues, and implementation challenges. For these indicators to be useful, sustainability should first be defined at the community level. Researchers suggest that the indicators should reflect all pillars of sustainability, namely, social sustainability indicators (e.g., sense of community, community activities), environmental indicators (e.g., resource use), economic indicators (e.g., local jobs and business activity), and governance/institutional indicators (e.g., local governance, policies, and regulations) (Lew et al. 2016; Turcu 2013). Besides these core sustainability pillars, several unique indicators can also be identified including unemployment, schooling, energy consumption, water consumption, waste use and disposal, access to healthcare, housing, public green spaces, economic infrastructure, business activity, conservation of nature, land use, transportation, local networks and collaborations, and public services and facilities (Mascarenhas et al. 2010). Different weights can be assigned to each set of indicators

depending on the unique conditions of the community.

Indicators of community sustainability often follow the community capital framework, and specific indicators are created to measure each form of community capital. For instance, while natural capital is measured by indicators such as the existence of certain plant and animal types, the amount of natural resource stocks, the degree of water supply, oil and energy, human capital is assessed by indicators such as demographics, education, professional training, access to health care, and other services (MacKendrick and Parkins 2004). In addition to typical forms of community capital, more specific dimensions such as environmental integrity, economic and social energy, health and well-being of citizens, recreational options, technology use, and process indicators have also been considered in community sustainability measurement (Lew et al. 2016).

All in all, the development of sustainability indicators helps reduce the complexity of community sustainability and generate programs and policies to improve it. Yet, beyond their individual presence, the interrelationships among these pillars should be carefully considered. That is, instead of seeing indicators as isolated pieces of information, the underlying networks and mutual sustainability mechanisms should be identified.

Summary

Community sustainability entails dealing with community-level social, environmental, and economic issues in a comprehensive and interconnected way. Along with outcomes, it can be described as a process of constant improvement so that communities evolve and change to attain collective goals. This process includes participation of diverse community members at broad scale, generating a common vision for future, developing sustainability principles, keeping an inventory of necessary resources and capabilities that the community would capitalize on, setting clear and measurable goals, evaluating progress and results by developing a framework

of sustainability indicators, and achieving open and transparent communication. It is quite likely that the interest on the topic of community sustainability will grow further through increasing attempts of integrating it with the notions of sustainability at broader levels.

Competitive Advantage

Lars Schweizer and Eva Maria Katharina Koscher
Goethe-University Frankfurt am Main, Frankfurt,
Germany

Synonyms

[Competitive edge](#); [Gamesmanship](#); [Relative advantage](#)

Definition

The term competitive advantage refers to a company's ability to outperform its competitors

and to separate from them by creating more economic value in the same given market (Augier and Teece 2016). A competitive advantage may include access to natural resources, or it can be more inherently to the firm's core, like better technology, a favorable cost structure, or other advantages in the value chain or resources of a company.

According to Michael Porter (1985, 1989), strategic management should be concerned with building and sustaining competitive advantage. He distinguishes between two methods how an organization can gain a competitive advantage over its rivals: differentiation advantage and cost advantage. They can be described as follows:

- A cost advantage occurs when a business can provide the same products or services as its competitors, but has lower costs.
- A differentiation advantage means that a business provides better products or services as its competitors.

Introduction

Having realized the struggle of companies with worldwide growing competition, Michael Porter shifted the attention of management thinkers to competitive strategies and the achievement of the competitive advantage itself (Porter 2008). Especially his books *Competitive Advantage: Creating and Sustaining Superior Performance* (1985), *The Competitive Advantage of Nations* (1993), and *Competitive Strategy: Techniques for Analyzing Industries and Competitors* (1980) had a huge impact on the understanding of competition and therefore also on strategic planning in order to enhance profitability. This led to the development of new concepts, management tools, and government policies that influenced whole industries.

The following parts will briefly summarize the main ideas behind the named concepts in order to inform about the most commonly known ways to achieve a competitive advantage.

Gaining and Sustaining a Competitive Advantage

According to Porter (1985, 1989), the first important step for a company that is aiming to sustain a competitive advantage is to choose an attractive industry or to improve the given industry's attractiveness. In a second step, companies need to decide if they want to achieve cost leadership or follow a differentiation or focus strategy (see also Generic Strategies). Implementing the right strategy will help a company to gain a competitive advantage over its rivals.

- **Cost Leadership Strategy:** Pursuing a cost leadership strategy, a company seeks to produce its products or services to the lowest costs in the industry. The sources of a cost advantage hereby depend on the structure of the industry and “may include the pursuit of economies of scale, proprietary technology, preferential access to raw materials, and other factors” (Porter 1985, p. 12).
- **Differentiation Strategy:** By choosing a differentiation strategy, the company's goal is to have a unique selling proposition (USP) which allows to sell its products or services to higher prices. Common approaches to generate such an USP are adjustments in product dimensions valued by consumers, different marketing strategies, and improved delivery systems. The differentiation strategy can only be successful if the costs that come with differentiation are lower as the price premium buyers of the product are willing to pay. While innovation can enable a company to produce to lower costs, it can also be one of the most successful sources of differentiation. Hence, a company that wants to differentiate itself from its competitors should encourage “innovation, individuality, and risk-taking” (Porter 1985, p. 24).
- **Focus Strategy:** There are two forms of the focus strategy: the cost focus and the differentiation focus. Both of those strategies are similar to the ones discussed above but differ in their competitive scope. While the cost leadership strategy and the differentiation strategy

both have a broad target, both variants of the focus strategy concentrate on “a narrow competitive scope within an industry” (Porter 1985, p. 15). Caused by the smaller scope, a company is then able to tailor the strategy exclusively to its focus group and therefore has the opportunity to perfectly fit the focus group's needs. In order for this strategy to work, different segments have to be identifiable and separable, and the chosen segment has to have either “unusual needs” (Porter 1985, p. 15) or a different willingness to pay.

- **Blue Ocean Strategy:** Blue Ocean Strategy (BOS) is a management concept which proposes that organizations, rather than going head-to-head with competitors, should try to create and exploit new market spaces, so-called blue oceans (Madsen and Slåtten 2019). Contrary to the strategies discussed above, the BOS aims to guarantee a firm superior performance by different means. Instead of facing competition in an existing industry, companies should aim for “uncontested market space” that makes “the competition irrelevant” (Mauborgne and Kim 2005, p. 1). When following a BOS, a company has to create demand whether by entering a new industry or by overcoming industry boundaries. The main way to achieve this is by breaking the “value/cost trade-off,” which was present in Porter's generic strategies, and instead pursuing differentiation and low cost at the same time (Mauborgne and Kim 2005, p. 7). By doing so, a company is able to increase the value not only for customers but also for itself through new opportunities for growth and hence economies of scale and network effects that make imitation hard. In order to align differentiation, low costs, and value creation, a company can save costs by “eliminating and reducing the factors an industry competes on” and enhance the consumers perceived value “by raising and creating elements the industry has never offered” (Mauborgne and Kim 2005, p. 7). The strategy promises to attract customers immediately and therefore guarantees a profitable and non-imitable growth, by which

potential competitors are outperformed. Since its introduction in the mid-2000s, the Blue Ocean Strategy has developed into one of the most popular concepts in the strategic management field and one of the biggest catchwords in the business world (Madsen and Slåtten 2019).

The Importance of Resources and Capabilities

Whereas the generic strategies and the Blue Ocean Strategy articulate strategic choices to be the main source and starting point for gaining and maintaining a competitive advantage, the resource-based view emphasizes that a company's resources and core competencies are the means to achieve superior performance. This view leads to a framework in which the identification of first resources and then capabilities (see also VRIO Analysis) is the main source of the competitive advantage and strategy selection is based upon the best possible exploitation of "the firm's resources and capabilities relative to external opportunities" (Grant 1991, p. 115).

Summary

In conclusion, every company should aim to create a competitive advantage. While this entry covers only the most commonly known strategies to achieve superior performance, there are countless other approaches a company can choose from in order to find the most suitable strategy. Because of its importance and urgency toward companies, the term competitive advantage, the nature of competition, and competitive strategies are expected to stay in the spotlight of management thinkers and researchers. Especially with changing consumer needs and renewed conceptions of the value chain through current ecological-centered debates, more opportunities for differentiation and incentives for efficiency enhancement and cost reductions will arise and will quite likely lead to the emergence of even more contemporary approaches.

Competitiveness

Francesca Gennari
Department of Economics and Management,
University of Brescia, Brescia, Italy

Synonyms

Coopetition; Global Competitiveness Index; Global network; Shared value; Stakeholder relationship management; Sustainable business model

Definition

The concept of competitiveness for both nations and businesses changed due to the globalization, the diffusion of information technology (IT), the high level of innovation, the Fourth Industrial Revolution, the spread of concepts as corporate social responsibility (CSR), and sustainability. For nations competitiveness means focusing not only on short- and medium-term productivity drivers but also on productivity over the longer term in order to balance the interests of different groups of people, within the same generation and among generations. This means the need to go beyond the mere economic well-being including other factors that promote a high-quality growth.

With regard to business, in the last decades, the interaction between sustainability and competitiveness has received considerable attention, changing the traditional point of view based on rivalry relations among companies, because of their product's characteristics and price, toward an approach considering the importance of cooperation, networks, relations with stakeholders, and the ability to create shared value with society as competitive drivers.

Introduction

Competition and competitiveness are terms frequently used in both public discussion and business about the organizations' ability to perform

according to their policy or strategic goals (Listra 2015).

Stigler (1988) defines competition as rivalry between individuals (or groups or nations), arising whenever two or more parties strive for something that all cannot obtain.

The globalization, the diffusion of information technology, the high level of innovation, the Fourth Industrial Revolution, and the spread of concepts of corporate social responsibility (CSR), and sustainability have changed in a very relevant way the traditional settings of competitiveness for both nations and businesses.

For nations competitiveness is traditionally defined as the set of institutions, policies, and factors which determine the level of productivity of a country (World Economic Forum 2011), mainly measured by the Global Competitiveness Index (GCI) that takes into account 12 drivers of competitiveness over the short to medium term. The conversation on sustainability and sustainable development, defined as a development path that satisfies the needs of the present without compromising the ability of future generations to meet their own needs (WCED 1987), led nations and international organizations to focus not only on short- and medium-term productivity drivers but also on productivity over the longer term. World economy should be socially cohesive, should live within its financial means, and should ensure the correct and efficient use of its resources. This new approach implies a reconsideration of competitiveness and related measures. In this light, sustainable competitiveness is defined as the set of institutions, policies, and factors that determine the level of productivity of a country while ensuring the ability of future generations to meet their own needs (World Economic Forum 2011), measured by sustainable competitiveness indexes.

Competition is a multifaceted concept that in business is mainly associated with the comparative advantage as a driving force of markets; many models were developed to capture the relations among existing and potential competitors (as Porter's five forces and game theories). In the last decades, the interaction between sustainability and business competitiveness has received

considerable attention, changing the traditional point of view based on rivalry relations among companies, because of their product's characteristics and price, toward an approach considering the importance of cooperation, networks, relations with stakeholders, and the ability to create value and share it with the society as competitive drivers.

Yet the productivity of a country is ultimately set by the productivity of its companies: an economy cannot be competitive unless companies operating there are competitive (Porter et al. 2008). It follows that the concept of competitiveness is wide and cannot be studied without a global perspective.

Theoretical Framework

Countries' Competitiveness

The attempt to rank countries' competitiveness and give a tool for benchmarking countries' strengths and weaknesses induced scholars and institutions to put several efforts in such indexes. An important milestone was reached in 2000, when Jeffrey Sachs introduced the Growth Competitiveness Index, based on a stronger academic foundation in economic growth theory. In fact, the main mechanisms identified by economists as creators of economic growth are the allocation of resources, the capital accumulation, and the technological advance. The efficient allocation of resources, according with Adam Smith (1776), depends on the division of labor and market competition. The capital should be intended as not only plants and equipment but also human capital, this last resulting from educational, health, and social politics. Finally, the technological advancement referring to products and production processes depends on the ability to create new technology or to adopt a technology that has been developed abroad. Technology is considered the current most impacting factor for a sustainable economic growth in the long-term, and the main difference among countries in the modern history is the ability to achieve technological innovation at a high rate. Basing on these considerations, Sachs proposed a new Growth Competitiveness

Index as sum of three indexes focused on the following pillars of growth: technology, public institutions, and the macroeconomic environment (Warner 2000; McArthur and Sachs 2001). In particular, the originality of this index refers to the separate consideration of growth factors affecting the world's core innovator economies and those affecting the non-core technological adapters.

Michael Porter introduced a companion Business Competitiveness Index (BCI) focused on the microeconomic drivers of prosperity. In the modern global economy, productivity depends less on what industries a nation's firms compete in than on how they compete, that is to say, the nature of their operations and strategies. There is no good or bad industry in this new "productivity paradigm" where the competitive advantage shifts from the ownership of resources (which are accessible at low costs) to the ability of assembling these resources to create valuable products and sources (Porter 2000). Porter suggests a different way to define the concept of competitiveness (Porter 2001). Competitiveness is not necessarily a zero-sum game where one country's gain comes at the expense of the others, but it can be a source of prosperity improving a nation's standard of living.

For a number of years, business leaders and decision-makers that wanted to understand the competitiveness of nations had to deal with two different measures. For this reason, in 2004, Sala-i-Martin et al. (2004) studied a Global Competitiveness Index (GCI), which includes both macroeconomic and microeconomic factors of competitiveness. One of the goals of the GCI was, therefore, to merge the two approaches into a single, unified, and global index that captured both the national and business components of competitiveness at the same time. Another goal was making the GCI a useful tool for policy and decision-making.

The concept leading the statement of this index is that the determinants of competitiveness are many and complex. This complexity is captured assigning the many factors that underlie competitiveness to 12 areas: (1) institutions, (2) physical infrastructures, (3) macrostability, (4) security, (5) human capital, (6) goods market efficiency,

(7) labor market efficiency, (8) financial market efficiency, (9) technological readiness, (10) openness and market size, (11) business sophistication, and (12) innovation.

GCI became the official index of the World Economic Forum in the 2005–2006 issue of the Global Competitiveness Report. Since then, the GCI has become the most widely used index of competitiveness around the globe, continuously under attention.

Porter et al. (2008) created a new GCI concentrating on the determinants of the productivity level that a national economy can sustain, which is the ultimate driver of national prosperity. The new GCI captures macroeconomic and microeconomic factors from which competitiveness arises. Macroeconomic factors operate indirectly to affect the productivity of firms in an economy; they are necessary, but not sufficient, for higher productivity. Microeconomic factors operate directly on firms in affecting productivity, and they are influenced by multiple stakeholders.

The spread of the concept of sustainability suggests relating sustainability with competitiveness and productivity, defining the sustainable competitiveness as a set of institutions, policies, and factors that make a nation remain productive over the longer term while ensuring social and environmental sustainability (Osorio et al. 2013). In particular, authors define the environmentally sustainable competitiveness as “the institutions, policies, and factors that ensure an efficient management of resources to enable prosperity for present and future generations,” and the socially sustainable competitiveness as “the institutions, policies, and factors that enable all members of society to experience the best possible health, participation, and security; and that maximize their potential to contribute to and benefit from the economic prosperity of the country in which they live.”

From these definitions emerges the need to go beyond the mere economic well-being including other factors that promote a high-quality growth.

Blanke et al. (2011) suggest to face the sustainable competitiveness issue from the point of view of the long-term vulnerabilities, with a Sustainable Competitiveness Index (SCI) composed by

indicators aimed at highlighting the areas where long-term vulnerabilities may manifest themselves (human capital, market conditions, technology and innovation, policy environment, and enabling conditions).

The Fourth Industrial Revolution (4IR) and the recession caused by the great financial crises of 10 years ago emphasize the fact that economies must invest in broader measures of competitiveness today to sustain growth and income in the future, improving resilience to shocks. The recognition that economic growth is a core driver of human development, also according with the Goals of UN 2030 Agenda, encourages the World Economic Forum to introduce the GCI 4.0 (World Economic Forum 2011), integrating the established aspects with new and emerging levers that drive productivity and growth. In particular, the role of human capital, innovation, resilience, and agility are considered key factors for the economic success in the 4IR. The findings affirm that the competitiveness is not a zero-sum game between countries, confirming that all economies have the opportunity to carve a path to competitiveness.

Another index focused on sustainable growth and wealth creation is the Global Sustainable Competitiveness Index (GSCI) by SolAbility (2017). The GSCI considers the fundamentals that shape the current and the future state (as competitiveness) of a national economy organized in five pillars: natural capital, social capital, resource management, intellectual capital, and governance efficiency.

Business Competitiveness

Companies must understand their competitive environment to define strategic and operational choices. The traditional model to study the competitive environment defines this last as the system of the existing and potential competitors within the same industry. Porter's model (1980), the so-called five competitive forces framework, suggests considering not only the competitive rivalry but also the threat of new entrance, the threat of substitutes, the bargaining power of customers, and the bargaining power of suppliers. All these relations are seen as moves of antagonistic

players where competitive interdependences arise from largely diverging or even completely opposite interests.

Today's turbulent competitive environment, and the diffusion of corporate social responsibility (CSR) principles, with the valorization of stakeholder perspective (Freeman 1984; Freeman and Dmytriiev 2017), emphasizes the importance of the sustainable company's development in the long-term, that is to say the ability to create value today and in the future thanks to relations' shifting from a mere competitiveness to a sustainable competitiveness (Gennari and Salvioni 2018).

This approach changes the way to look at the relationships between competitors and between business and society. Since the late 1980s, an alternative paradigm to the competitive one has diffused in the strategic management literature (Contractor and Lorange 1988; Hakansson and Snehota 1995; Powell et al. 1996): the cooperative model. This paradigm reveals that companies search for collaborative advantages for which the strength and success of a given company result in the strength and success of other companies.

Companies establish partnership and collaborative networks to enhance innovation capability and competitive advantage (Bellamy et al. 2014); competition tends to become coopetition as a condition where competition and cooperation coexist (Brandenburger and Nalebuff 1995; Schweitzer and Galinski 2015). According with the view, firms interact among each other because of a partially convergent interest structure in a coopetitive game characterized by a win-win structure (Padula and Dagnino 2007).

Sustainable competitiveness implies also the ability by company to produce shared value that is generating economic value in a way that also produces value for society, by addressing its challenges, connecting company success with social progress (Porter and Kramer 2006, 2011). In this way, corporate success and social welfare are not a zero-sum game, considered that they are not opposite but interdependent. According with Porter and Kramer, every company operates within a competitive context, which significantly affects its ability to carry out its strategy, especially in the

long run. Social conditions form a key part of this context. Competitive context can have strategic importance for both companies and societies: ensuring the health of the competitive context benefit both the company and the community.

In addition, companies should be fully engaged with the achievement of the UN 2030 Agenda Sustainable Development Goals (SDGs) as the main drivers for the economic development. Businesses are recognizing that having a sense of sustainable purpose inspires confidence in leaders and stakeholders alike can lead to a competitive advantage in a time of change and uncertainty while addressing the economic, social, and environmental challenges facing humanity (Deloitte 2017).

Key Issues

Sustainable competitiveness, both for countries and companies, refers to the acknowledgment of the value intrinsic in the relationships with stakeholders, because these relations can create a competitive environment where all can win.

With regard to nations, this means managing economic growth balancing its positive and negative (e.g., environmental) effects according with a global view. Countries' development should be really interpreted as equitable and balanced, meaning that, in order for development to continue indefinitely, it should balance the interests of different groups of people, within the same generation and among generations, and do so simultaneously in three major interrelated areas (economic, social, and environmental). Therefore, sustainable development is about equity, defined as equality of opportunities for well-being, as well as about comprehensiveness of objectives (Soubbotina 2004). This view opens the debate about the most appropriate measures and indicators of country competitiveness.

The corporate approach toward competitiveness according with a sustainable view implies the need to revise business models in a way that assure companies to address the economic, social, and environmental challenges, in order to secure their long-term success and the social progress

too. This situation is changing the traditional way to make business, and the competitive drivers increasingly focus on the creation of shared value in the long run.

By the way the business sees itself and embeds this purpose within the strategy and the organization; thanks to culture, values, and internal and external stakeholder engagement, companies can address the economic, social, and environmental challenges facing humanity and respond to the accelerating challenges to securing long-term financial success (Deloitte 2017). This is the key to compete in global markets (Salvioni and Gennari 2017).

New business models oriented to sustainability emphasize the importance of new attention for success drivers, which can be both material and intangible. Know-how, distinctive abilities which cannot be easily replicated, relationships with the network's actors, alliances, brand value, and human capital are all assets on which the market competition can take place. In the current new economy, a business can be built around a pattern of thinking rather than a model of products and services (Dobre 2013). Hence, the competitiveness must be rethought in the light of new key success factors able to support the development of companies in the long run thanks to a corporate global responsibility which includes economic, social, and environmental aspects (Salvioni et al. 2016).

The system of intangible assets a company is able to create as a source of sustainable competitive advantage should be protected and increased in value by means of an effective and transparent process of communication with stakeholders (Brondoni 2010). The challenges in the competitive environment induce new ways and contents in corporate communication. In particular, the traditional financial communication is completed or integrated with new information about the social and environmental performance and the intangible assets (e.g., intellectual capital statement). The increase of information needs requires also new methods for content dissemination, connected to the use of more and more appropriate tools to facilitate both the timeliness

and the access to the information (Salvioni and Bosetti 2014).

Summary

Global markets call for new and complex competitiveness for both countries and companies, which have to face the challenge about the ability to understand the requirements of wide and different categories of stakeholders, considering also the future impacts of actions adopted to meet these expectations. Traditionally, competitive relations are grounded on organizations' power, as economic growth or market quotas in a zero-sum game.

The spread of the concept of sustainability changes the way to compete and the drivers for success and social progress, which shift from resources and products to the ideas and relations. The future of competitiveness seems to be a global network where different actors co-create value according with a sustainable way of living and make business. No longer can governments and companies autonomously create value, but they must build new theory on how to compete in an emerging opportunity space (Prahalad and Ramaswamy 2004).

This change induces the revision of governance models and communication contents and tools. Organizations require internal mechanisms to understand, capture, and manage the new critical success factors according with a view aimed at maximizing the opportunities and minimizing the risks today and in the future. New key performance indicators arise, and communication activities about the economic and socio-environmental performance nurture the relations between the organizations and their stakeholders in a shared process of value creation.

Compliance

Nirmala Lee
Guildhall School of Business and Law, London
Metropolitan University, London, UK

Synonyms

Compliance is synonymous with the terms [Acquiescence](#); [Assent](#); [Concurrence](#); [Conformity](#); [Consent](#); and [Observance](#) and is used in association with [Conventions](#); [Practice](#); [Regulations](#); [Rules](#); or [Custom](#) which would need to be complied with.

Definitions and Introduction

The term “comply” was derived from the verb comply in early fourteenth century, “to fulfill, carry out” from Old French compli, past participle of complir “to accomplish, fulfill, carry out” from Vulgar Latin complire, from Latin complere “to fill up.” The sense of “to consent” began in c.1600. Compliance (n) from comply +ance dates from the 1640s. Compliance can be defined as “the function of identifying relevant legislative, regulatory and best practice requirements and implementing the necessary arrangements, systems and controls so as to facilitate adherence to these obligations” (Mills and Haines [2015:18](#)).

The Debate About the Need for Regulatory Compliance

There is no consensus about the necessity of regulation and compliance (Dragomir [2012](#)), and this is considered to be “heavily contested intellectual territory” (Davies and Green [2008:12](#)). Arguments range from rigid state control to no regulation. On the one hand, there is a view that free markets, left to themselves, do not always deliver the optimal good to society and that when employment stagnated, government must step in (Keynes [1936](#)). On the other hand, regulation can be found to be too detailed and intrusive. There may be over-demand from consumers who perceive regulation as a free good and oversupply by the regulator who is risk averse (Goodhart et al. [1999](#)). There is also the moral hazard of the assumption that if something is not covered by regulation, it does not have a regulatory dimension, and that care/compliance is not needed. There is some consensus for the view that “regulation approved in a crisis must be subsequently fine-tuned” (Greenspan [2007:374](#)). In the context of the rising consciousness of the need for corporate sustainability, from both environmental and social contexts, there are increasing calls being made for compliance with sustainability standards.

Compliance and Innovation in Relation to Sustainability

Sustainability is broadly defined as an organization’s ability to balance short-term and long-term needs of stakeholders (direct and indirect) through the sale of value-adding goods and services, which are produced in line with the earth’s carrying capacity and exert a maximum positive social impact (Porter and Van der Linde [1995](#); Nidumolu et al. [2009](#)). Challenges are faced by companies when they seek to ensure compliance with corporate sustainability standards. They would need to examine their practices in light of compliance standards and take corrective action as required (Grimm et al. [2016](#)).

First, in the context of sustainability, compliance relates to certifiable management systems in various areas such as quality, health, safety, and environment. For example, “sustainability management accounting and control” envisages the inclusion of social and environmental measures, in addition to the conventional focus on financial outcomes. Environmental quality and economic growth were viewed as trade-offs, but this view is rapidly changing to one of the identifying simultaneous targets for growth, sustainability, and societal development (Porter and Van der Linde 1995; Ambec et al. 2013).

Second, in the context of sustainability, compliance also relates to corporate governance, specifically corporate governance codes, where companies and executives are asked to “comply or explain”: comply with such codes or explain why they do not. Doyle et al. (2019) explore the link between Governance, Risk, and Compliance (GRC) and innovation in the context of sustainability; they propose a practice-based concept of compliance–innovation and set out its significance for sustainability. The concept envisages the central role of knowledge integration across business domains as the basis of modern competitive advantage. They outline how the integration of GRC and innovation domains drive commercial exploitation for both environmental sustainability and business sustainability.

Sustainability Compliance Index (SCI)

Corporate concern has been expressed for introducing a sustainability perspective early in the manufacturing and other processes and addressing this concern, Hallstedt (2017:258) attempts to identify and develop sustainability criteria and index in relation to product life cycle stages and socio-economic sustainability principles; his index demonstrates to what degree a product or process concept performs in relation to a sustainable solution as indicated in the table below:

Sustainability Index Compliance (SCI) scale	
SCI 9	The strategic sustainability criterion is fulfilled. Reached excellent level
SCI 6	Have implemented a strategy with concrete actions for how to move step-wise towards more sustainable solutions. Moving strategically towards excellent level (SCI9)
SCI 3	Compliance with socio-ecological related regulations. A low but acceptable level
SCI 1	Lowest level of sustainability compliance. Not acceptable level
0	No information to score a SCI value. Need more research and investigation

The SCI scale is listed in descending order of compliance, and the final row represents unavailable information. The index is useful for flagging up the current level of compliance and underlines the need to undertake further work in order to reach the top excellent level.

Compliance and Due Diligence

Due diligence refers to the process of collecting, examining, analyzing, and researching information in order to make decisions that comply with regulatory requirements. Prieto et al (2021:1) describe the concept of due diligence as “a methodology for assessing risks.” While due diligence processes may differ from industry to industry, the overarching aim of the process of due diligence is to mitigate risk and facilitate compliance. Thus, the process of due diligence could help ensure compliance with sustainability requirements and mitigate risks that may arise on account of non-compliance.

Summary/Conclusion

Compliance has implications for sustainability. It is crucial that corporate dealings in their day-to-

day practices are compliant with relevant regulations and conventions, not only for sustainability and ethical issues, but also for preserving the long-term health of companies and businesses. Firms would need to recognize that in the long term, profits are linked to sustainability.

Synonyms

[Compliance Management](#)

Definition

Compliance is the necessity to meet the regulatory obligations for a company and it requires the organization to embed a culture that will affect the attitude of people within the organization to act in line with the regulations. Compliance also indicates accountability and an obligation to sustain relevant codes of conduct (Singh and Bussen 2015). Some compliance requirements for organizations are not in the form of regulations, they can be industry-specific, can be based on several

standards, or can be shaped by the expectations of the society.

Compliance Management System (CMS) is the designation of a program for an organization that intends to keep the organizations on the right side of regulations. CMS aims to create an integrated system that gathers the processes, controls, functions, and tools to mitigate an organization's compliance with regulations. CMS designs organizations that prohibit violations of law and lead them to be respectful to the community. CMS, in short, aims to create an effective compliance structure within an organization. CMS is of crucial importance for companies to avoid fines and penalties and to prevent reputational scandals.

CMS programs in organizations define specific rules that apply to the organization and establish a framework or strategies to ensure the organization sticks to those rules. CMS programs can be viewed as strategies to align a company to strong corporate governance applications. The design of a CMS program requires the board of directors' oversight, the full commitment of all employees, and design of effective compliance programs. Even though compliance is blamed for decreasing efficiency within an organization, it may help organizations to save millions of dollars and their reputation as well. Various corporate scandals revealed the necessity of establishing CMS.

A Brief History of Misconducts and Evolution of CMS

Despite the recent popularity of the subject, CMS went through various stages of development starting from the beginning of the twentieth century. In this part, a brief history of the CMS is presented.

Beginning of the twentieth Century: Even if the term compliance became popular in the last three decades in the aftermath of the famous corporate scandals, its origins date back to the beginning of twentieth century in the USA. At the beginning of the 1900s, compliance was a concern for pharmaceutical companies. Food and Drug Administration (FDA) suppressed the drug companies for public safety concerns, which led to the

design of internal compliance management systems within those companies.

The 1970s: The emergence of corporate scandals led to the formation of CMS. Watergate scandal in the 1970s shed light on the corporate and governmental corruptions and revealed that many companies bribed foreign government officials to gain business advantages (de Beaufort Wijnholds, Onno 2015). With the initiatives of the Securities Exchange Commission (SEC) and Internal Revenue Service (IRS), a new law, the Foreign Corrupt Practices Act (FCPA) was passed in 1977 to prevent misconduct and to ensure trust. FCPA serves as a significant landmark for organizations willing to design an effective compliance system (Cassin 2011).

The 1980s: 1980s showed a various number of corporate misconducts and those misconducts took place in various industries. The first sprout of scandals of the decade started in the defense industry. Following the various bribery scandals in the defense industry in 1977, media reported the abuse and waste by defense contractors (Sethi 2011). These scandals have created new rules under Defense Industry Initiative on Business Ethics and Conduct, which is also crucial because of its promotion for reporting misconduct to government authorities. This initiative is an early settlement for whistleblowing.

Various other misconducts took place in the savings and loans industry, which was resulted from the collapse of significant financial companies. The scandals in the financial industry led the way to the Federal Deposit Insurance Corporation Act of 1991, which required the design of stronger internal compliance programs (Singh and Bussen 2015).

Another striking misconduct took place by Ford Pinto automobiles when their gas tanks exploded when hit behind. Despite the denial of Ford for any wrongdoing, there was compelling evidence that the company was aware of the issues related to the problem and did nothing to fix it (Spencer and Sims 1995). This misconduct added product safety and safety concerns to the list among other issues related to noncompliance.

The 1990s and 2000s: This period witnessed lots of financial scandals related to the biggest

publicly traded companies. The most famous ones are Enron, WorldCom, Tyco, etc., which caused the investors to lose a significant amount of their wealth and resulted in the loss of investor confidence. The common point in these scandals is that the companies tried to illustrate a better performance of themselves in their financial statements by using fraudulent accounting practices. In Enron's case, they hid their losses by transferring their liabilities to shell companies and they made investors believe that their business was booming. They also built a fake trading floor and used their own employees to call the trading floor to impress and trick the investors to think that the business operations are immense. Arthur Andersen, a former audit company, reviewed and approved their questionable financial statements; they even hid and destroyed certain documents related to the performance of the company. In late 2001, it was revealed that the company restated 3 years of financial statements and significant information. Later at the end of 2001, Enron was filed for bankruptcy, which was the largest in US history. Arthur Anderson was also found guilty of obstruction of justice, and they went out of business.

The result of these accounting frauds led the way to new regulations to prevent these scandals. Thus, the Sarbanes Oxley Act of 2002 (SOX) was passed, which contributed significantly to the compliance of the organizations. Several reforms were introduced to increase corporate responsibility, enhance financial disclosures, and eliminate accounting fraud. Public Company Accounting Oversight Board was also introduced as a result of the act to oversee auditing activities. SOX formed the basis of "corporate governance principles," which promote ethical conduct, conflict avoidance, and compliance with applicable laws, rules, and regulations, and fair, accurate, and timely disclosure of information (Singh and Bussen 2015).

The 2010s and current case: Despite the various attempts to minimize accounting frauds and environmental concerns and increase public safety and product safety, there are still significant cases of noncompliance in the current last two decades, e.g., British Petroleum fraudulent oil spill, Volkswagen diesel emission scandal (see

Jung and "Alison" Park 2017), etc. Apart from these, various scandals emerged as a result of the advancement in information technologies. Buzz, which is the social networking function of Google, was condemned to violate the privacy promises to its users in 2011. As a result, Google had to comply with a lot of terms that include establishing, design and implement a privacy program to protect the privacy of personal information. A more renowned scandal about Facebook burst at the beginning of 2018. The so-called Cambridge Analytica Scandal revealed that Facebook shared information belonging to 87 million users to Cambridge Analytica, a British political consulting firm. The scandal was revealed with the help of a whistleblower and it is asserted that the information gathered helped Donald Trump to win the elections (Cadwalladr and Graham-Harrison 2018). Federal Trade Commission (FTC) approved a fine of \$5 billion on Facebook. Other social media platforms like Twitter and LinkedIn are also under the investigation of regulators in many countries over the way they use personal data to provide targeted advertising. The advancements in technology suggest that the designing of advanced forms of Information Technology Governance should not be overlooked.

The incidents mentioned above show that misconducts happen all the time and they show variety over time. Some of the misconducts reveal a one-guy problem, where one bad guy causes a corporate mishap. Most cases are on the other hand systematic and signal an organizational culture problem. Nonetheless, the outcomes of noncompliance are costly for sure. The outcomes of the noncompliance penalties can be monetary penalties as well as other requirements that involve extensive oversight and accountability with implementation costs and other activities. Google's 2011 settlement agreement with the FTC involves nonmonetary penalties. Following the violation of privacy promises, Google was forced to design a comprehensive privacy program to protect personal information. To maintain this program Google had to assign a coordinator to identify and work up the risks and train all its employees on privacy. Moreover, they had to hire

a qualified third-party professional to provide privacy assessments. The penalties Google faced involve lots of work and costs, even if they did not get any monetary penalties. Considering the high costs of noncompliance, designing an effective Compliance Management Systems within an organization is a must.

Designing an Effective Compliance Management System

A Strategic Approach to Compliance Policy

Laws, rules, and regulations within an industry are often associated with the performance of companies like product safety, human resources policies, information privacy and security, environmental sustainability, timely and accurate dissemination of information, and financial reports. These all will assist a company to perform better, and meet stakeholder expectations in the long term (Steinberg 2011). A successful manager will get it and makes a clear statement about a company's compliance with applicable laws, rules, and standards. This statement should be made clear to everyone who is working internal and external with the company. External stakeholders involve suppliers, who are also equally crucial to comply with the laws, regulations, and standards. The study of Turker and Altuntas (2014) reveals that supplier compliance with the buyer company's code of conduct is seen at the heart of a complex system of the sustainable supply chain. In a broader sense, by following such compliance programs, companies set the rules of the game for suppliers in order "to monitor the process of implementation and to measure the level of progress among their suppliers deriving from these existing standards" (Turker and Altuntas 2018).

Aligning Compliance Processes into Business Processes

Despite the call for a Chief Compliance Officer (CCO) to ensure an effective CMS, it is more significant to include every manager to adapt their operations to compliance processes. It is very important to harmonize compliance processes to the goals, tasks, and objectives of a

company. If this harmonization is achieved, it would not be possible to consider CMS a burden for the company. Furthermore, it is necessary to define operational procedures based on compliance, which will focus on the problems identified through audits. These procedures may highlight compliance processes like the detection of legal obligations, designing breach monitoring and reporting programs, complaint handling issues, and incentive and reward programs for diligent workers.

Designing a Program Based on Integrity and Ethics

An effective CMS program must be based on an ethics policy that matches the operations and organizational culture of the company. Previous corporate scandals display that organizational culture lies at the heart of an effective compliance program. The scandals arose because there was something wrong in the organizational culture, which could be identified by weak internal control mechanisms as well as tolerance for unethical corporate behavior. Thus, it is necessary to set a policy, which is comprehensive, organized, and understandable by everyone in the company. To make everyone understand and apply the program, training programs should be available to everyone, which will be reinforced by incentivizing employees who are persistent in compliance. The company should also design programs to whistleblower channels and protect those workers that whistleblow the non-compliance within the company. It should be clear to every worker that using such channels is to ensure cultural integrity and ethical values of the organization.

Designing an Ongoing Program to Maintain Compliance

CMS of an organization should be monitored and well documented so that the program ensures efficiency and effectiveness. The program should include internal and external audits to maintain compliance and it should be adaptive to changes in the regulations, laws, and standards. Thus, it is also crucial to monitor the changes in the standards and regulations. Especially independent

external reviews are significant to maintain and meet the current legislation.

Adapting the Technology

The company should design systems that will adapt the use of technology in their programs. Deploying technology to monitor the operations, processes, and transactions of the company will centralize the activities of the company. In that sense, it will be easier to address concerns related to noncompliance. Also, the use of technology will enable the provision of timely and correct data to evaluate the current compliance of the company. Technology will facilitate human resource-related tasks to be handled, such as providing training and awareness regarding compliance. The systems designed by technology will provide support on measurement and reporting of procedures, risks, and controls (Steinberg 2011).

Summary

Various corporate scandals throughout the last century revealed the necessity of compliance to the norms, standards, and regulations. Despite compliance to the laws and maintaining compliance being considered costly, noncompliance results in higher monetary, nonmonetary, and reputational costs for the organizations. Thus, it is crucial to design Compliance Management Systems within an organization to keep it on the right side of the regulations and expectations of the customers and society. The existence of a well-established CMS will not only help a company to be in line with regulations but also let it be more effective and raise its performance. To design an effective CMS, the contribution of every employee is of high importance. To ensure a well-functioning CMS, it is necessary to have a strategic approach to compliance policy, align compliance processes to business processes, design a program based on ethics and integrity, design an ongoing and active program, and adapt the technology to the processes.

shopping; Compulsive spending; Consumerism;
Impulse control disorder; Impulsive buying;
Oniomania; Pathological buying; Shopaholic;
Shopping addiction

Definition

Compulsive buying is an all-consuming, often incessant, preoccupation with buying. The urge to buy something (anything) is so strong that the afflicted individual finds it impossible to resist. It is often described as an unhealthy obsession with buying (Kagan 2020). Simply spending hours in online browsing or physical window shopping without buying anything is also classified as compulsive buying (Black 2007). This obsession is severe enough to hinder normal functioning of the individual. The person spends hours if not days researching purchases, checking for deals, simply buying more than planned as a routine, etc. This needless overpowering urge to buy often, predictably leads to psychological, personal, work related, financial, and sometimes even criminal consequences (Black 2007).

The need to shop is so overwhelming that no amount of resistance and distraction help, but in fact, only make it worse. This is a condition seen commonly in most forms of addictive behavior like taking drugs, gambling, binge eating, or other eating disorders among others. Pathological cases include symptoms of depression, anxiety, and stress which are relieved (momentarily) immediately after a shopping episode (Müller et al. 2019). This is often followed by guilt and low self-esteem leading to further buying sprees creating an unbreakable, destructive, and escalating cycle. Triggers to this behavior could be multifold and often include low moods, boredom, ebbing confidence, finding sales irresistible, and omnipresent advertising among others (Black 2007).

The shopping is not in any way limited to items of need but progresses into justifying unnecessary purchases consistently. Some of the common consequences of compulsive buying are spiraling debts, relationships breakdown, and compulsive hoarding among others (Black 2007).

Background

Buying as an addiction was first recognized by Kraepelin (1915). He called it the “impulsive insanity.” Bleuler (as cited in Black 2007) then is credited with grouping compulsive buying, also known as Oniomania, with kleptomania and pyromania, in the early twentieth century.

It was not a widely researched topic up until the 1990s when the discussion of this condition became more mainstream. Today, there is still some resistance to classify compulsive buying as a medical disorder and therefore has led to various different classifications such as behavioral disorder or mood disorder. The medical grouping of this affliction can fall under various disorders like addictive disorder, obsessive compulsive disorder, or impulse control disorder (Black 2007).

Some studies suggest that age and gender play a definitive role in compulsive buying disorder with young females being more susceptible (Black 2007; Rose and Dhandayudham 2014). Other studies suggest that compulsive buying affects both men and women equally (Koran et al. 2006; Müller et al. 2010; Biolcati 2017).

Faber (1992) states that those showing symptoms of compulsive buying often talk about pleasurable highs and rushes during the (pre)planning and the actual act of shopping itself. In the same vein, Granero et al. (2016) compare compulsive buying disorder and gambling disorder and state that the same regions are involved in both these disorders and that they showed a high level of association.

On the other hand, Spinella et al. (2015) suggest that compulsive buying is not a medical condition that can be treated with medication but just an extreme form of habit manifested in general by people. In other words, compulsive buying behavior is driven by materialistic values and attitudes toward consumption and money.

Treatment

Compulsive buying (disorder) when diagnosed is often treated with behavioral therapy and impulse

control medications. Other recommended forms of treatment include group therapy, couple therapy, counseling, and use of antidepressants (Koran and Aboujaoude 2014).

Some Specific Triggers

Triggers can be both psychological and sociocultural. Psychological triggers could include anxiety, stress, depression, self-confidence, moods, social status, loneliness, obsessive nature among others. Other triggers could come from the social environment of the individual (O’Guinn and Faber 1989).

Market-based economy and disposable incomes tend to facilitate the obsession. But this compulsive buying may also be manifested in individuals who have relatively less disposable income. In other words, despite the income situation, this behavior is partly driven by the ease of access to shopping opportunities (Zadka and Olajosy 2016).

Some Examples

Online/Internet Shopping – this development has transformed the experience of shopping completely. The availability of millions, if not more shops, from the comforts of home combined with home delivery make the shopping experience limitless (Müller et al. 2019). There is nothing stopping anyone from shopping anytime for anything, anywhere. This opening up of shopping world creates endless opportunities for compulsive buyers to indulge. The idea of receiving a package results in anticipation followed by the utter joy of actually receiving the package and its contents. This euphoria is soon dissipated, and the next cycle begins to relive the previous experience which over time becomes less and less satisfactory creating an endless destructive loop (Rose and Dhandayudham 2014).

Online shopping is additionally dangerous since it usually removes physical cash completely from the transaction. The ease of using credit or debit cards was always manifest, but with the payment details being stored in the system of the

frequented online stores, results in implicitly creating less and less connect with the actual position of the money in the accounts.

With new technology, now one can pay with their fingerprints, with their phones, etc. These forms of payments make it very difficult to gauge how much money is really being spent, resulting in serious debts (Müller et al. 2019).

Sophisticated marketing – the savvy of the advertising world is unbeatable, and this has been fine-tuned with the use of big data mining and tracking surfing habits. Every time someone buys something online or simply searches for something, their digital footprint is left behind. This footprint gets tracked and mined. Companies now do not need to segment their markets anymore since they have access to individual data. The landscape of marketing has changed completely which in many ways is a very good development, but not so for a compulsive buyer. People, in general, receive adverts tailored for them based on their online surfing behavior making it very difficult for the afflicted individual to ignore their already weak impulses (Müller et al. 2019). The temptation is brutally hard, incessant, and omnipresent.

Developments in the production industry – the above problems are made worse by developments in the said industry itself. For instance, Fast Fashion, which involves producing cheap versions of catwalk designs quickly to exploit current trends. Availability of cheap goods at an increasingly rapid pace drives the appetite for more and more buying with higher frequency (Stanton 2018). The use and throw culture permeates, and once again creates a never ending cycle of buying repeatedly.

Online “trenders and influencers” – This is an interesting development in that it accords the trenders and influencers a chance of livelihood while doing what is the order of the times and indulge their own needs. This phenomenon of trending and influencing, however, once again fuels addictive consumption dramatically (Müller et al. 2019).

All of the above exacerbate the problem of compulsive buying for a compulsive buyer.

CSR and Compulsive Buying

The damage is obvious; unbridled consumption has consequences for everyone even companies. According to Kerin et al. (2011) if companies aid and encourage compulsive buying directly or indirectly, the consequences will spill over way beyond the personal domain of the compulsive buyer. Targeted marketing, incessant adverts in email boxes and online website, frequent flash sales, limited time offers, and fast moving items all create serious pressure on individuals who find it difficult to fight their impulses.

However, it might be unfair to hold companies ransom to their focused and sophisticated marketing strategies which seek to increase their market share and maximize revenues. These are very valid and justified objectives any company has. But in so far as contributing to an ever-increasing social malady, companies do have a moral responsibility to bear. Simply selling as much as possible in the pursuit of higher revenues is not a sustainable solution in the long run for anyone.

One cannot deny that the afflicted individual should also attempt to recognize and address their issues. But this is not always possible because compulsive disorders are debilitating on many levels.

The compulsive buying habit is driven by a culture of acceptable debt which is debatably asocial in itself. If a company notices that certain repeat customers are buying their products at a relatively higher frequency, then maybe there needs to be a way to flag such cases. The company bears a social and moral responsibility to investigate the issue instead of milking the individual for their last cent. One can argue that caveat emptor should not be the rule here.

The gambling industry is regulated to a certain extent, in that, there are certain maximum caps in place to help prevent an individual from completely going overboard with their money. Perhaps there can be a way whereby flagged cases of compulsive buying have a monthly spending limit in place to prevent excesses. Such limits could also be put in place by the lending agencies, credit card issuers, and banks for

instance. The consequences of not doing so could simply result in higher levels of bad uncollectible debts (Granero et al. 2016).

Alternatively, a very recent example of conscious consumption comes from the pilot program on renting clothes being put in place at Selfridges, the high-end store on Oxford Circus in London (“Selfridges to offer,” 2020). Here, in the special context of the corona virus, Selfridges, in order to tempt its younger and more sustainability conscious clientele, has decided to approach a novel way of shopping which involves renting of clothes and goods rather than buying and owning them. This move qualifies as a clever CSR strategy helping both the company and the affected stakeholders.

In all practical sense, there is no immediate reason why companies should engage with a consumer who is spending repeatedly and a lot on their products – this would be shooting themselves in the foot. But by not engaging with what is now considered to be a global phenomenon of debt-driven unnecessary consumption would be, by any standard, bad CSR.

Definition

The issue of conflict, and its management in an organizational sense have been in the radar of academics, training organizations, and other institutions for the last 30 years. The skill of conflict resolution is sought after in the candidates for most of the jobs. The Merriam-Webster definition of conflict is “competitive or opposing action of incompatibles.” While this broad definition is enough to define the word, the understanding of the underlying reasons is essential for conflict management. Conflict occurs when two or more parties have opposing needs, incompatible objectives, and scarce resources at their disposal and can be observed on personal, group, or organizational levels. However, the perception that conflict

is negative and destructive, thus should be prevented is outdated. Conflict management is a concept that aims to limit the negative outcomes of conflict and harness the positive aspects of it. There are more than enough studies that prove well-managed conflict can provide positive outcomes in terms of productivity and sustainability. In order to properly manage conflict, one must recognize the sources that generate conflict, and the appropriate style of conflict resolution that is suitable for that situation and the parties involved.

Introduction

What differentiates “conflict management” from its predecessor “conflict resolution” is the understanding that conflict is not an all-destructive and negative notion, but through management can provide positive outcomes as well (Strauss 1982). The management of conflict can be exercised by the disputants or a third party (Wall and Callister 1995), the third party being a manager in majority of the cases. What the disputants and/or the managers must do as a first step in the way to managing conflict is the identification of the source. Thereafter the parties can manifest “styles” of mediating behavior ranging from “assertive” to “cooperative.”

Conflict Management Styles

Early studies in conflict management relied on one-dimension measure for conflict management

which put “cooperation” and “competition” on opposite sides (Vliert and Prein 1989). It was Blake and Mouton’s (1964) work that re-designed this measure as a two-dimensional framework. Over time these dimensions were defined as “assertiveness” and “cooperativeness” by Thomas (1976) and “concern for self” and “concern for others” by Rahim (1986). The transition between these two dimensions results in five different styles of handling managing conflict. Blake and Mouton (Blake et al. 1964) named these five styles on the basis of the attitude shown by the managers: forcing, withdrawing, smoothing, compromising, and problem solving. Later, Rahim (1992) within the scope of “concern for self” and “concern for others” defined these five styles as integrating, obliging, dominating, avoiding, and compromising (Fig. 1).

Integrating style shows high concern for both self and others. This requires collaboration between parties, information flow, and understanding the incompatibility among parties in order to reach a solution that is favorable for each party. The way this style creates solutions is through confrontation which leads the way for problem solving. *Obliging* style shows low concern for self and high concern for others. In this style one party tries to satisfy the others’ needs and wants which can be achieved through acts of generosity, sacrifice, and obedience. The obliging party neglects their own concern in order to meet the concerns of the other. *Dominating* style shows high concern for self and low concern for others. Also known as competing, a dominating party

Conflict Management,
Fig. 1 Conflict management styles.
(Source: Derived from Rahim (2017))

tries to force their way to reach their objective and while doing so, ignores the needs and wants of the other party. A dominating party is prone to “pulling rank” with their subordinates to reach their goal. *Avoiding* style shows low concern for both self and others. Whether it be putting off an issue for later or just removing one’s self from a conflict situation, an avoiding party does not satisfy either their own concerns, or the others’. In order to not to deal with it, people with avoiding tendencies may be hesitant to accept there is even a conflict at all. *Compromising* style shows intermediate concern for both self and others. As the name suggest it requires compromises, from both sides of a conflict. Searching for a middle ground that is mutually acceptable for both parties is the foundation of this style of conflict management.

Complementary Forms of Conflict Management

There are few practices that serve as complementary methods for conflict management, which target interpersonal, intragroup, and intergroup conflicts. *Mediation*, which can be applied on both personal and group levels, requires an impartial third party, which can be selected by the disputants or appointed by a superior, that will lead or structure the discussion to help parties meet on common ground (Eunson 2012). *Moderation*, while similar to mediation, requires a group setting and deals with the working processes of groups. The moderator should be impartial and make sure every participant is equally involved in the proceedings, in this method the main aim is not conflict management, but reaching an objective. *Supervision* method is effective with teams and/or groups where there is a complex set of relationships. In this method, along with the group objectives, the development of individuals is also a priority. It allows for peer consulting and voicing of problems that arise in a work group. *Coaching*, not to be confused with the common usage for the “boss” of a team setting, is the exercise of providing counsel for individuals in order to help them reach their objectives by dealing with their problems. While forming the strategy to achieve the goal, coaching can help with conflict prevention

along with conflict management. *Team development* is the practice of forming a group into a “team.” A professional advisor manages the process of becoming a team by helping the members communicate better, co-operate, form relationships, and develop a team identity. The main aim is to get the group working together, solve conflicts, and even prevent them by eliminating reasons for conflict that may have arisen if this method was not implemented, such as forming of factions, power plays, and cultural barriers (Proksch 2016).

Summary

Conflict management is a concept that has been visible in the literature for over 30 years, and its inception stems from the lack of coverage the term conflict resolution had. Conflict management perspective accepts conflict is unavoidable, and rather than exhausting its efforts on conflict prevention, focuses it on making the most out of it. However, each conflict and its’ parties are different and require different approaches/styles for optimum outcome. Taxonomy of conflict management shows that these styles can range from “assertive” to “cooperative” or as later conceptualized as “concern for self” and “concern for others.” The process of conflict management can be supplemented by complementary methods such as mediation, moderation, supervision, coaching, and team development. Each of these methods target different settings (intrapersonal, interpersonal, intragroup, intergroup). Proper execution of conflict management paves the way for improved productivity and sustainability.

Conflict Minerals

Amos Owen Thomas
Stockholm Business School,
Stockholm University, Stockholm, Sweden

Definition/Description

Access to, exploitation of and trade in mineral resources such oil, gas, metals, gems, rare earths, and others valuable in the global marketplace are often causes and/or consequences of interstate and intrastate conflicts. These often scarce and strategic resources are often found in developing countries and emerging economies, though their exploitation is typically controlled by multinational corporations from the industrialized world. As a consequence of protracted wars, failed states arise which are unable to exercise full sovereignty over their territory and this contributes to human rights abuses, kleptocracy, money laundering, and arms purchases – by government forces, separatist movements, terrorist groups, and the like. Despite

embargoes and boycotts imposed by intergovernment or nongovernment organizations, the mineral resources produced under those conditions enter into global supply chains where they are unsustainably processed and incorporated into consumer and industrial goods marketed worldwide.

Conflict Case-Studies

Diamonds in West Africa: In 2000, the UN Security Council embargoed rough diamonds from conflict zones in Sierra Leone controlled by the Revolutionary United Front forces, which were noted for human rights abuses and war crimes. Since this insurgent group was supported by the then president Charles Taylor of neighboring Liberia, the diamonds were smuggled through his country which also produces diamonds and thus entered the global supply chain.

Oil and energy in the Middle East: In the mid-2010s, much of the oil-rich Levant region came under the control by the so-called Islamic State of Iraq and Syria, which used much of those reserves to fund its terrorist regime. ISIS was successful in smuggling much of this output through a Mediterranean port in Turkey where it was mixed with oil from Caspian Sea states also destined for legitimate global markets. While supply chains for energy resources are particularly prone to wars, terrorism, civil strife, and embargoes, given their strategic importance any disruption results in swift illicit circumvention.

Rare-earths in Central Africa: Only in 2008 did the UN Security Council embargo arms to nonstate groups in the conflict in eastern Congo, for the first time linking this to funding by the trade in mineral resources. However, no groups or corporations have been identified for appropriate sanctions despite evidence provided by NGOs. Among the corporations identified as trading in resources from the Congo conflicts zones in defiance also of OECD Guidelines are the major European, Asian, and American miners, traders,

and smelters. These are in addition to African ones from neighboring countries, the latter exercising military control over regions across their borders.

Coltan in Latin America: Although Venezuela was believed to have reserves of coltan, it was only in 2009 that its discovery deep in its Amazonian jungles bordering Colombia was announced along with a ban on private mining enforced by the military. However, that has not kept away artisanal miners or prevented smuggling of the ore into Brazil where it feeds domestic industry demand as well as gets exported. As the left-wing government of Venezuela remains at odds with the right-leaning pro-US government of Colombia, tensions could result in conflict. As this border area is on the route for drugs-smuggling to the USA, the syndicates involved in this have diversified into the equally-profitable trade in coltan ore.

Coal in South Asia: There has been domestic conflict involved in the more mundane extraction of coal in mineral-rich jungles inhabited by tribal peoples increasingly economically and politically disenfranchised. Their cause has been supported by Naxalite or Maoist-communist insurgents who have long been in conflict with the Indian government. Ironically the state-owned coal-mining corporations are alleged to be paying millions of rupees to the Naxalites as “protection-money.” Meanwhile the Naxalites themselves have operations to process profitably the coal mined illegally by tribal villagers, then bribing police and government officials to not intervene.

Regulation and Enforcement

In order to provide economic livelihoods of the poor, OECD guidelines allow multinational corporations to engage with artisanal mines and informal traders, provided there are no armed groups or human rights abuses involved. These guidelines have been influential in the drafting of regulations around the world, as in the EU and China. Thus, impetus was provided for

corporations to establish responsible supply chains for minerals from conflict and high-risk regions. Subsequently specific industry codes, certification, and auditing requirements have been inaugurated such as by the World Gold Council, London Bullion Market, and Dubai Multi-Commodities Centre.

In postfinancial crisis USA, the Dodd-Frank Act regulated public corporations, incorporating a provision requiring them to divulge information on conflict minerals contained in their products. Still the majority of the consequent filings claim being unable to ascertain whether their minerals are conflict-free, besides lobbying to see this law amended. Suppliers to global electronic manufacturers argue that once refined by smelters it is near-impossible to determine whether the minerals are from conflict regions, let alone that its trade helps fund armed groups and corrupt governments. Thus, less than a quarter of US corporations fully comply with the law, while about half do not file at all and face no adverse legal or economic consequences.

Compliance with conflict-free minerals regulations may have had unintended consequences for the industry in Africa. With regulations being enforced in industrialized countries, developing and emergent market traders tend to be the only ones still buying there, often at discounted prices and with their own smelter within the mined country to mask mineral origins. China has also signed “resources-for-infrastructure” agreements with African governments within which pricing of minerals and the extent these are conflict-zone sourced remains opaque. Persistent consumer demand for products with conflict-free certification may yet motivate corporations to increasingly source their minerals sustainably from Europe, North America, and Australasia.

Summary

Significant as the contribution of mining has been to resource-rich developing countries in Africa,

this has not translated into much economic development. Human rights is a generally issue in the extractive industries, covering practices ranging from people displacement, forced labor, workplace health-and-safety to detention and torture by security staff. Collapsed law-and-order along with lack of concern about environment and human rights during conflict are favorable to trade in resources. Especially if armed groups and their sponsors benefit economically from that trade, these parties tend to maintain the underlying conflict.

Despite challenges of their implementation in remote regions, the science and technology exists to track mineral resources from sourcing through processing to incorporation into products, both industrial and consumer. Yet both international and national laws need to be made more effective so that all involved in illicit extracting and trading in conflict minerals could be held responsible for the crimes committed. This means not only representatives of multinational corporations, local agents, governments, and de facto forces but manufacturers and marketers of the end-products as well. Ultimately it will take discerning buyers demanding products be conflict-free and sustainably sourced that will change practices along the global supply chain.

Background on Confucius

Confucius (*Kong Fuzi* or *Kung fu tzu* in Chinese) was a Chinese philosopher, educator, and political thinker. He lived over 2500 years ago (551–479 BCE) and was the founder of the *Ru* School of Chinese thought. He was born into a period of the War of the Seven States

characterized by severe violence and intellectual competition (Graham 1989). In such a period, Confucius pragmatically became an itinerant philosopher in order to ensure that his views were spread extensively. He wrote copiously about the pragmatic rules of living needed to ensure political and social success (Ames and Rosemont 1998).

Confucius was a very popular teacher and his ideas have provided for a fertile ground for the flourishing of Chinese culture throughout history (Chai and Chai 1973). This is evident in generations of competitive literary examinations or merit system (Brett 1997) in China; Eastern societies that were located within China's cultural orbit, like Korea, Japan, and Singapore; and among overseas Chinese communities. Confucianism is a "philosophy of life" or "the way" in the tradition of non-organized religions. Hence, its values have continued to be embedded in the social life of the Chinese people for millennia as "customs" and traditions. Hence, it is critical to look at Confucius' precepts in its original form in order to try and tentatively grasp the author's original intentions.

Premise of Confucian Ethics

The Western world's knowledge of Confucianism is primarily through the Jesuit, Matteo Ricci's writings (Roy et al. 2018). In many ways, Confucius was considered as the equivalent of what Socrates was to Western philosophy, although their approaches to ethics were starkly different (Yu 2005). Confucius' ideas are best reflected in the *Lunyu* (or *Analects*) which broadly focus on the education and comportment of the "ideal" man – how individuals should live life and interact with others, as well as the forms of society (Van Norden 2002).

It is worth noting that in addition to Confucianism, the Chinese orientation toward life has also been shaped by Taoism and later, Buddhism. Each philosophy shared the emphasis on harmony and discouraged abstract conjectures. Taoism's teachings focused on opposition, contradiction, change, and cycles (the *yin* and the *yang*). It

stood for a deep appreciation of nature, the rural life, and simplicity. Buddhism, which originated in India, came to China a few 100 years after the advent of Taoism and Confucianism. It provided an epistemology, or a body of knowledge. Like the earlier two orientations, Buddhism also harped on the tenets of harmony, holism, and the mutual influence of organizational systems.

Correlates of Confucian Ethics

As compared to Western countries, Eastern countries scored high on the Confucian Work Dynamism Index. This Index was positively correlated with the economic growth of countries (Franke et al. 1991), entrepreneurship orientation, and a high "marginal propensity to save." In other empirical studies, the Index was negatively correlated to "this year's profits," but positively correlated to "profits 10 years from now."

Hofstede and his coauthors in their later empirical studies observed that the Index measures only specific features of Confucian ethic and ignores others such as filial piety and hence reinterpreted the meaning of this construct as "*Long-term Orientation*." This dimension portrays the furthering of virtues oriented toward future returns, particularly perseverance and thrift. Given the limitation of an overall insight into Confucius value-system, we propose an alternative set of "ideal types" in order to facilitate Western companies' charter of new political territories.

Certain facets of Confucian societies and their related explanations have been questioned. First, a high rate of savings may be caused by comparatively high costs of consumption coupled with the high taxes on consumption and the poor availability of social security for the elderly, rather than just long-term orientation. Second, the Index included other items, like, "ordering relationships by status and observing this order" and "having a sense of shame" that have inconsequential association with long term association. Third, some negatively related items, such as "respect for tradition" and "personal steadiness and stability" are not necessarily inversely related to long-term orientation. To the contrary, an appreciation of how

history and tradition define opportunities and capabilities for the future can be part of long-term orientation.

There are, of course, positive (Lam 2003) and negative uptakes on Confucian value-system (Ip 2009) as well as attempts to diagnose overlaps of Confucian values with Western values (Yeh and Xu 2010). Confucian Dynamism is also associated with a system of *authoritarian pluralism* distinguishable from the liberal democracies of the Western world. For example, drug trafficking is heavily penalized in countries such as Singapore, Malaysia, and Thailand. Divorce rates are significantly lower than those of the Western societies as family is relied as a form of social insurance. Attacks on other beliefs are relentlessly pursued, since most societies are pluralistic as far as religions are concerned. Finally, the press is free, yet not a “fourth estate.” This means that while freedom of press is valued as a stipulation for good governance, the press has no absolute right and is expected to blend in with the national consensus.

Even though Eastern perspectives are not represented in the definitions of culture, Boyd’s (1974) study found similarities in the expansion of leadership attributes in Confucian China and Victorian England in that leaders in both countries were expected to display good manners, good physical conditioning, and classical training. Lately, in tune with our concern, some (e.g., Ailon 2008) have started to point out that interpreting ethical values in one culture and applying them to other cultures demands caution. Furthermore, based on the works of other authors such as Ozkazanc-Pan (2008) highlights the shared concerns of representing facets of non-Western cultures using Western lenses.

Confucius’ teaching also provides a different perspective on virtue ethics – what kind of people we want to be through our actions and how our decisions may impact the lives of others surrounding us. Provis (2010) argued Confucian ethics has significant similarities to Aristotelian virtue ethics, sharing similar ideas of practical wisdom. Furthermore, ideas of moral judgments and virtue

ethics traditions born of Confucius and Aristotle are consistent with modern ideas about intuition in managerial decision-making. However, according to Chan (2008), while Confucian ethics provides “interesting” parallels with contemporary Western-oriented business ethics, it also diverges in significant ways. These include a greater emphasis on hierarchy, *guanxi*, social traditions, and harmony. We also believe Confucian ethics provides some unique philosophical and intellectual perspectives on human virtues that will help us shape our contemporary business ethics better.

China’s current promotion of Confucian ethical values is a reflection of its growing international power and its desires to garner domestic legitimacy as a benevolent and enlightened government and ensure domestic peace (McGregor 2007). More critically, it is imperative to understand Confucian values as extant cultural underpinnings of organizational management practices in China. Such understanding is important in any Chinese-value-dominated country. For instance, Tsui-Auch (2004) demonstrated the impact of Confucian values on the management structures of professionally managed family businesses in Singapore. In another study Woods and Lamond (2011) examined Confucian moral philosophy to determine its impact on managers’ self-regulation. Values tend to be sticky, and it is critical to negotiate such value-paths. Only then can one strategically conduct business ventures within the boundaries of the rising great power, which in the business world is referred to as the “China, Inc.” (Fishman 2005).

Summary and Conclusion

Confucius lived over 2500 years ago, yet his teachings have immensely influenced Chinese culture as well as those of other Southeast Asian countries. Confucianism has been a dominant philosophy in this region, which has recently witnessed unparalleled prosperity. Specifically, China has instituted several Confucius institutes throughout the world to spread the country’s culture. Although substantial prior

research has attempted to interpret his thoughts and teachings.

There are direct implications for Confucius's teachings on management practices. For instance, what is the proper role of financial rewards for salespeople? Confucianism recognizes that intention and remuneration are independent of each other. In practicing a profession, the individual's main criteria should be to be virtuous and help others, rather than seeking material benefits for self. Conversely, it was society's responsibility to remunerate everyone based on the quality of work performed, and hence valuable work should be highly rewarded.

With the remarkable economic transformation of China and other Southeast Asian economies in the last decade, Confucian ethics will continue to be of interest to scholars and businesses throughout the world. It will be imperative to understand the underpinnings of these societies in order to successfully conduct business in this region of the globe.

Definition/Description

The terms preservation and conservation are often confused and are used to mean the same thing. However, differences exist. Preservation aims to maintain as such the areas of the Earth what are so

far untouched by humans. Environmental preservation is often regarded as a deeper form of environmentalism or ecocentrism (Enviropedia 2018). Conservation, on the other hand, means careful protection of something. Its goal is a planned management of natural resources, e.g., water and wildlife, flora and fauna to prevent exploitation, destruction, or neglect (Dictionary Merriam-Webster 2018). The term is gradually extended to cover human rights, industrial, and commercial context of environmental concerns (Dictionary 2018). Conservationists are persons who accept that change and progression are necessary for a better future, but only when the changes take place in ways that are not wasteful (Enviropedia 2018). They argue that environmental waste and pollution will cause problems and suffering not only for the present but also for future generations. Environmental conservation is often regarded as a more shallow form of environmentalism.

Conservation and protection of many-sided biodiversity is fundamental for continuous life on Earth. The loss of species represents an unacceptable drop in the available gene pool and the potentially irreplaceable loss of species that could provide the bases for social wellbeing and economic development of human societies (UNCED 1993; UNESCO 2014). Conservation is one of the key action strategies that form a part of the philosophical and practical approach to implementing sustainable development.

Key Issues

Conservation and sustainable development represent one of the most important ways of thinking in natural resource management and policy (Schelhas and Lassoie 2001). Conservation includes various subdivisions (Table 1).

The 1970s and 1980s marked important milestones in the discourse on environmental conservation. One major development during that period was the establishment of the United Nations Environment Programme (UNEP) following the 1972 United Nations Conference on Human Environment in Stockholm, Sweden (Rowland 1973). The main motivation behind this development was the

realization that the natural environment was increasingly becoming unable to sustain life, both human and other forms. Of great concern was the need to put under scrutiny the environmental consequences of the various human activities (Makokha 2013).

The first international document on living resource conservation was *World Conservation Strategy* (IUCN et al. 1980). It was produced with inputs from governments, nongovernmental organizations, and other experts. World Conservation Strategy emphasized conservation stating (p. 1):

Human beings, in their quest for economic development and enjoyment of the riches of nature, must come to terms with the reality of resource limitation and the carrying capacities of ecosystems, and must take account of the needs of future generations.

This is the message of conservation. For if the object of development is to provide for social and economic welfare, the object of conservation is to ensure Earth's capacity to sustain development and to support all life.

The document targets policymakers, conservationists, and development practitioners with its core tenets of protection of ecological processes and life-support systems, preservation of genetic diversity, and sustainable utilization of species and ecosystems.

Dower (1992) notes that since the 1980s, two important concepts have been at the center of the debate on environmental conservation and development, namely, "sustainable development" and "the right to development." World Conservation Strategy (1980) guided the United Nations General Assembly in 1983 to harmonize environmental conservation and human development needs (WCED 1987). According to Makokha (2013), this recognition underscores the ethical underpinnings not only of development but also of environmental conservation.

Over the past 60 years, many advances have been made for fostering understanding of the limitations and sensitivities of the biosphere, and minimizing detrimental effects of human activities on the environment. There is more than one

Conservation: Sustainability, Table 1 Subdivisions of conservation and their descriptions

Subdivision	Description	References
Architectural conservation	Secures the survival or preservation of buildings, cultural artifacts, natural resources, energy or any other thing of acknowledged value for the future	Simpson (2016)
Conservation biology	Provides principles and tools for preserving biological diversity, i.e., species, communities, and ecosystems that are perturbed, either directly or indirectly, by human activities or other agents	Soulé (1985)
Conservation economics	Investigates how human welfare and the natural environment interact over time, with an eye towards the future	Conservation Economics Institute (2018)
Conservation ethics	Work from the idea of respect for the things people are protecting, preserving for future generations, acting as a steward and seeing the natural world merely as a resource to be exploited	Environmental Science (2008)
Conservation finance	Is the set of mechanisms for investing in an ecosystem, directly or through intermediaries, that aims to conserve the values of the ecosystem for the long term	Huwylar et al. (2014)
Conservation genetics	Preserves species as dynamic entities capable of coping with environmental change	Frankham et al. (2002)
Conservation law (environmental law, environmental and natural resources law)	Is body of rules, regulations, orders, and statutes, concerned with the maintenance and protection of the natural environment of a country. It provides basis for measuring and apportioning liability in cases of environmental crime and the failure to comply with its provisions	Business Dictionary (2018)
Energy conservation	Looks for ways to reduce energy consumption	Griffin and Steele (1986)
Habitat conservation	Is a management practice designed to conserve, restore, and steward habitat areas for native plants and animals, especially conservation-reliant species to prevent their extinction, fragmentation, or reduction in range	Lexicon of food (2017)
Heritage conservation (heritage science, conservation science)	Encompasses the identification, protection, and promotion of things that are important in our culture and history	Fulton (2006/2015)
Marine conservation (marine resources conservation, ocean conservation)	Is the protection and restoration of marine species, populations, habitats, and ecosystems in oceans and seas worldwide. It is also mitigating human activities such as overfishing, habitat destruction, pollution, whaling, and other issues that impact marine life and habitats	Kennedy (2018)
Preventive conservation	Includes all measures and actions aimed at avoiding and minimizing future deterioration or loss	ICOM (2008)
Soil conservation	Is the protection of soil from erosion and other types of deterioration, so as to maintain soil fertility and productivity	OECD (2003a)
Water conservation	Refers to the preservation, control, and development of water resources, both surface and groundwater, and prevention of pollution	OECD (2003b)
Wetland conservation	Ensures that wetlands can continue to fully deliver their vital role in supporting biological diversity and human well-being. According to the Ramsar Convention, <i>wetlands are areas of marsh, fen, peatland, or water, whether natural or artificial, permanent or temporary, with water that is static or flowing, fresh, brackish, or salt, including areas of marine water; the depth of which at low tide does not exceed 6 meters</i>	Medwet (2018)
Wildlife conservation	Preserves both species and species diversity and seeks ways to promote the wild life of captive animals	Zhou et al. (2016)

way to conserve biodiversity. In situ and ex situ are the Latin words for “on-site” and “offsite.” They are two different but complementary approaches to biodiversity conservation. In situ conservation means maintenance of ecosystems and natural and seminatural habitats, viable populations, and species in their natural surroundings (Figs. 1 and 2) and in the case of domesticated or cultivated species in the surroundings, where they have developed their distinctive properties (Dudley 2008). Ex situ conservation in its part occurs when a specimen of a species is translocated to more appropriate locations such as in a zoo or a botanical garden (Hay-Edie and Bulus 2013). Ex situ conservation should be used as a “last resort” or as a supplement to in situ

conservation, e.g., when a climate change or other cause threatens the survival of a species in a region. Because ex situ conservation is rarely enough to save a species from extinction, it is necessary to improve links between in situ and ex situ conservation efforts (Dudley 2008).

Biosphere reserves are one of types of in situ conservation. In 1971, UNESCO (United Nations Educational, Scientific, and Cultural Organization) created Man and the Biosphere (MAB) program to facilitate intergovernmental cooperation in promoting harmonious relationships between people and their environments; and in 1995, it published criteria for establishing of biosphere reserves (Manley and Hayes 2006). According to these criteria, a biosphere reserve should (UNESCO 1995):

1. Contain a mosaic of ecological systems representative of a major biogeographic region, including a gradation of human influences
2. Contain areas significant for biodiversity conservation
3. Offer opportunities to explore and demonstrate approaches to sustainable development on a regional scale
4. Extend over an appropriately sized area to serve the three basic functions
5. Identify appropriate zones (core, buffer and transition ones) to accomplish functions

Conservation: Sustainability, Fig. 1 Peacock butterfly in Seitsemien National park, Finland. (Photo: J. Jeronen)

Conservation: Sustainability, Fig. 2 Old forest in Seitsemien National park, Finland. (Photo: J. Jeronen)

6. Establish an organizational structure that provides for the involvement and participation of a range of authorities, communities, and interests
7. Plans, programs, and policies that support the functions and activities of the biosphere reserve

Three basic functions mentioned in the criteria are (1) conservation – contribute to the conservation of landscapes, ecosystems, species, and genetic variation; (2) development – foster economic and human development which is socio-culturally and ecologically sustainable; and (3) logistic support – support, e.g., for environmental education and training, research and monitoring related to local, regional, and global issues of conservation and sustainable development. Core areas again consist legally protected area(s) managed to sustain indigenous biota and natural processes, and a buffer zone consists a legally or administratively established area that typically adjoins or surrounds the core area. A transition area in its part surrounds the core area and buffer zone and supports a variety of resource uses and human activities characteristic of the larger region (UNESCO 1995).

Protected areas are by no means uniform entities. At one extreme a few sites are so important and so fragile that no one is allowed inside, whereas other protected areas encompass traditional, inhabited landscapes and seascapes where human actions have shaped cultural landscapes with high biodiversity (Dudley 2008).

Productive landscapes such as seas and marine areas, timber forests, agricultural lands, and grasslands are also important for biodiversity through producing ecosystem services for human beings. In September 2015, 193 countries formally adopted the 2030 Agenda for Sustainable Development, which consists of 17 sustainable development goals (UN 2015). Two of these objectives are directed specifically at the conservation and the protection of water and terrestrial ecosystems. The goal 14 includes the idea of conserving and sustainably use of the oceans, seas, and marine resources, and the goal 15 stresses protection, restoration, and promotion of sustainable use concerning terrestrial ecosystems. The latter one also emphasizes the sustainable management of

forests, the fight against desertification and the prevention of land degradation and the halting of biodiversity loss (UN 2015). This recognition has led to the promotion of sustainable fisheries, sustainable forestry, sustainable agriculture, and sustainable grassland management.

Close monitoring of biodiversity belongs to important conservation practices. It involves regular checking of the overall health of ecosystems and the species living within it (Hay-Edie and Bulus 2013). Monitoring is especially important when the activities are carried out on an industrial scale because their impact is greater than the impact of similar activities carried out on a smaller subsistence scale by local communities. Conservation mechanisms include also law or community enforcement. When the laws are not respected, illegal logging, mining, and bushmeat hunting erode the benefits of conservation efforts.

In many cases, traditional knowledge has contributed to protecting wildlife and ecosystems and to ensuring a “natural balance.” According to Convention on Biological Diversity (2018), traditional knowledge comprises of “knowledge, innovations and practices of indigenous and local communities embodying traditional lifestyles relevant for the conservation and sustainable use of biological diversity.” For example, traditional agroecosystems represent centuries of accumulated experience of interaction with the environment by farmers without access to scientific information, external inputs, capital, credit, and developed markets (Altieri and Merrick 1987). Such skills, using locally available resources, have often translated into farming systems with sustained yields (Egger 1981; Wilken 1977). In many places, the community members have developed well-recognized and respected rules that are often stronger than any law and have been practiced for generations (Altieri and Merrick 1987). Biodiversity conservation practitioners should therefore ensure that the communities relying directly on natural resources are involved in conservation initiatives, and guarantee their active participation during the whole conservation process.

Biodiversity conservation requires the participation of many different groups of people,

working with various conservation mechanisms both in situ and ex situ. The health of an ecosystem is closely related to the quality of life of its inhabitants. Biodiversity is a key component of the “environmental health” pillar of sustainable development providing people with basic ecosystem goods and services.

Summary

Environmental conservation and sustainable development are two interrelated branches. Conservation contributes to the conservation of ecosystems, species, genetic variation, and landscapes, but it also includes a planned management of natural resources and community reserves. Development fosters economic and human development which is ecologically and socioculturally sustainable. So, these terms focus on nature conservation on one side, and on the other environmental protection, social progress, and economic growth. Therefore also protected areas are various. They include both endangered natural areas and cultural landscapes with abundant biodiversity. The promotion of sustainable management of natural resources, sustainable fisheries, sustainable forestry, sustainable agriculture, and sustainable grassland management are the main approaches for preserving cultural landscapes for long-term social, economic, and ecological benefits.

Environmental conservation and sustainable development are important ways of thinking in natural resource management and policy. There are different approaches involving different groups of people and different strategies and timeframes for achieving similar goals. United Nations and governments have created various frameworks and guidelines for global, regional, and local conservation and preservation action. Biodiversity conservation practitioners should also take into account that the communities have traditional knowledge which may support conservation and sustainable development. Therefore, citizens should be encouraged to participate in conservation work.

Conspicuous Consumption/ Positional Goods

Xavier Landes
Stockholm School of Economics in Riga,
Riga, Latvia

Synonyms

Conspicuous spending; Distinctive competition; Positional externalities; Positional goods; Positional spending; Status-seeking; Veblen goods

Definition

Conspicuous consumption refers to the consumption of goods and services motivated by considerations of relative standing, i.e., one's position in the distribution of income, status, prestige, occupations, or any other relevant dimension. This kind of consumption is aimed at signaling such a position to other individuals. The central feature is to be visible, thus spending tends to be concentrated on goods that ostensibly signal one's position (e.g., sports' cars, luxury items, fancy vacation destination). Such goods are characterized as "positional," i.e., their demand is primarily determined by individuals' willingness to indicate their relative position within a given social context. In economic textbooks, they are labeled "Veblen goods," after the economist Thorstein Veblen. Veblen goods are goods which demand swells in response to price increase. Conspicuous consumption and positional goods challenge traditional economics which stipulate that individuals are only sensitive to absolute considerations, they are mutually disinterested,

and their satisfaction only reflects the amount they consume (including satiety effect). Positional goods question this assumption since their demand is determined by their social scarcity. If accessible to too many individuals, a good loses its signaling quality. Conspicuous consumption is not restricted to the better-offs in the society. It captures a broader phenomenon: the very fact that the social life imposes standards of decency, such as what is appropriate to possess, wear, eat, and spend, on everyone within a given society.

Introduction

Conspicuous consumption highlights the eminent social dimension of spending. Spending in a social context is not trivial. Consumers use strategically their consumption, both in terms of quantity and quality, for addressing signals around them, to whom they evaluate being their inferiors, peers, and superiors. In that context, some goods are consumed because they have the characteristic of displaying one's (high) relative standing due to scarcity and price. In other terms, spending decisions can be determined by one's relative position, i.e., not in isolation of others' actions.

The idea that the social context matters for spending is barely new. However, it has matured over the last couple of centuries and reformulated around the concepts of conspicuous consumption and positional goods.

A Brief History

In *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776), Adam Smith notes that although a linen shirt is not necessary for a laborer, not wearing one in public signals poverty and destitution. This illustrates standards of decency that translate into spending standards. The same dynamic is at work at schools nowadays when children and teenagers feel pressured to wear specific brands in order to be socially included.

The first contemporary description of conspicuous consumption is due to Thorstein Veblen. In *The Theory of the Leisure Class* (1899), he offers a sociological (a bit idealized) account of

ostensible behavior and consumption patterns of the leisure class, i.e., the better offs in the society who take pride of not having to work. He shows that many spending decisions have no other function than demonstrative, viz. to conspicuously assert spender's social class. In that context, the very fact of spending on unnecessary ever futile, goods reinforces this signaling effect.

In *Income, Saving and the Theory of Consumer Behaviour* (1949), James S. Duesenberry develops the idea further. He proposes the relative income hypothesis. It tackles the traditional assumption that individuals only care about their absolute level of income. For Duesenberry, individuals' economic decisions, in particular spending, are less guided by their absolute income than by their relative one, i.e., how much they earn in comparison to others.

The concept of positional goods is due to Fred Hirsch. In *Social Limits to Growth* (1976), he makes a key distinction between material and positional goods. Material goods are goods that bring satisfaction in direct relation to their inner qualities. For instance, a shirt or potatoes will provide satisfaction (economists use the concept of utility) to the consumer depending on how good they turn to provide decent clothing for the upper body part or their nutritional characteristics. Positional goods are goods which produce relative satisfaction, i.e., satisfaction that depends on their social scarcity. Examples are luxury items.

The analytical framework has been broadened by Robert H. Frank (1999) who claims that individuals are motivated by concerns for their relative standing, i.e., their social position or status. It is not only, or mainly, a question of types of goods. Individuals are not led by absolute considerations (e.g., their income, spending, satisfaction of their own needs, and achievements), but by relative ones (i.e., how well they perform by comparison with others, how much more they spend or earn).

Individual satisfaction does not only (or even mainly) depend on one's absolute level of income, achievements, consumption, etc., but also on one's performance compared to other people. Individuals compare themselves to whom they consider as peers and to whom they perceive

belonging to the social class immediately above them. This creates what Frank coins as "expenditures' cascades": a process of imitation and competition in which individuals constantly spend more. The idiom "Keeping up with the Joneses" captures this dynamic.

A Prisoner's Dilemma

The issue is not simply one of individual prestige or success, but of concrete life opportunities. The kind of signal one sends through its consumption impacts others' perception of her. It impacts the access one can get to specific social networks, one's jobs and sentimental opportunities, and so forth. For instance, Frank remarks that success at a job interview among participants of equivalent quality depends on appearances. If applicants want to have a fair chance, they should invest in an at least as-good-outfit as their best dressed competitor. This initiates a race-to-the-bottom (i.e., a race during which participants harm each other by raising spending standards). The overall dynamics is a game with no absolute winner, everyone ending up at the same position (so the relative structure is kept), but with higher spending (so everyone is worse off).

Such a dynamic has the characteristics of what is called in game theory a *prisoners' dilemma*, i.e., a situation where individuals are stuck with a mutually harmful strategy but have no incentive to change it (which game theorists name a Nash equilibrium). Collectively, everyone would be better off if spending less on houses, cars, clothes, electronic appliances, vacation, gifts, and so forth. Because a big portion of those expenses matter for one's life opportunities, for the kind of education one can offer to her children, and so on, no one has interest to scale down her expenditures.

Conspicuous consumption is a controversial concept, not so much in regard to the existence of such spending patterns, but to the seriousness of the issue. It could be claimed that the concept oversimplifies complex social dynamics and that individuals are less subject to relative standing than assumed. In other words, conspicuous consumption would be descriptively faulty.

Nonetheless, conspicuous consumption is not solely a descriptive concept. There is a normative

component, a critique of modern consumerism. The critique could be read as one of human envy. Individuals would be mutually interested in the sense that they would want to outperform their peers, spend more than them for the only sake of staying ahead. However, envy is not necessary for conspicuous consumption to exist, especially under the formulation elaborated since Veblen until Frank. According to Hirsch for instance, it is the quality of the goods that makes them positional, independent of individuals' psychological inclinations. For Frank, individuals engage in conspicuous spending because their capacity of reaching their (nonenvious) goals depends on their relative standing.

Works in evolutionary biology tend to strengthen this interpretation. Humans are social animals and, as such, their social performance matters for a broad array of outcomes: what they can achieve in life, their status, the respect they get from others, the access to mating partners, how they are treated by others and authorities, and so forth. An important dimension is health performance. Studies in epidemiology and public health have shown that morbidity and life expectancy strongly depend on status. The most prominent are the *Whitehall studies* (Marmot 2004) that screened British civil servants. The main discovery is the lower the status of individuals, the more chance of cardiovascular diseases and death, even after adjusting for education, income, and other factors.

Thus, because one's relative standing determines one's health condition (among other things) and since individuals sense this, they compete for maximizing their status. More importantly, they compete for displaying their status. As previously mentioned, by doing so, they would engage in a rat race where everyone is constantly increasing the spending standards for everyone else.

Positional Externalities

Frank proposes the concept of "positional externalities" (Frank 2008) for describing the costs imposed on each other due to conspicuous consumption. By searching to outspend their competitors, individuals waste time, material resources, etc., at a high psychological price

(e.g., stress, anxiety, and depression). Conspicuous consumption generates negative externalities in the sense that everyone is affected by the spending decisions of distant people who raise spending standards. A negative externality is an external cost, imposed from outside on an agent or a group without their consent and for the benefit of another agent or group. Externalities are costs that are not included in the original transaction and, hence, are passed on third parties, namely individuals or entities who are not part of the initial exchange.

An example of negative externality is the river polluted by a factory operating nearby. By dumping chemicals in the river, the factory contaminates the water downstream, killing fishes, making swimming unhealthy, rendering water undrinkable, and so forth. In that case, the factory and its customers who are parts of the original exchange externalized their costs onto third parties, the people who live downstream.

The concept of positional externalities underlines the normative dimension of conspicuous consumption. Consuming positional goods cannot be seen as a benign, voluntary, and private act. The creation of external costs turns the issue into a collective action problem, which is used for justifying regulation, especially from public institutions. Actually, if individuals by their spending patterns impose costs on each other and if they cannot reasonably step out of this competition, then it may be legitimate to regulate individual behavior.

The situation is actually worsened by the amount of resources spent in conspicuous consumption. First of all, individuals end up consuming goods and services they do not need. For example, everyone needs a home, but no regular size family *needs* a 500 m² mansion with 15 bedrooms, 3 kitchens, and 5 bathrooms; everyone needs decent clothes to wear, but no one needs *luxury* clothes; and so forth. By doing so, individuals end up saving less than they could and should, which is a normative judgment.

Second, this translates into too low saving rates at the social level. Too low savings rates are damageable for a national economy since it involves higher interest rates, more difficulties to invest in future projects and development, and so

forth. In a context of open economies, too low saving rates may lead to increase national external debts (because of the high level of importations), and it may undermine the value of currency and degrade the balance of payments.

Third, this translates into misallocation of productive resources (capital and labor) throughout the economy, with industries producing positional goods diverting resources that could have been used elsewhere with better results on collective well-being. For instance, more resources could have been used for financing public health, schools, infrastructure, and so on.

Possible Responses

Regulatory responses have been proposed. One of the most discussed options is to implement an incremental consumption tax (Frank 1999), i.e., the marginal rate of consumption increases by brackets with the volume of consumption until, under Frank's proposal, reaching a confiscatory rate (close to 100%). The aim is to incentivize the top spenders to cut down their expenses in favor of saving. In virtue of the "expenditure cascades," it is expected that all income categories will downsize their expenditures as a consequence of increased fiscal pressure, but also due to reduced imitation pressure.

Various criticisms could be addressed to this proposition. One is that would unacceptably interfere with individuals' right of using their income. In other words, it would violate property rights. However, this objection does not properly take into consideration that property rights are always limited. One widely accepted limit, even among libertarian thinkers, is the harm inflicted to others. A solid justification for public intervention is indeed to prevent such harms, as stipulated in John Stuart Mill's harm principle (Mill 1859).

Few defend the idea that one's property can be used without restriction to hurt anyone else. Yet, it is possible to deny that positional externalities constitute harms that legitimate public regulation. One could reject the presentation of conspicuous consumption as a prisoners' dilemma: Individuals would always be free and able to engage or step out of distinctive competition. Therefore, they could choose not being harmed.

Another objection is to locate the issue in the resentment felt by less successful individuals. Any regulation of consumption would then give way to people's envy, which would express morally dubious intents. Moreover, it could erode the work ethos and emulation based on competition, which will harm socioeconomic development. One may also question the reality or extent of positional externalities by arguing that they either do not exist or are less serious than alleged.

Other criticisms stress the possible consequences of such a tax. For instance, heavily taxing consumption could depress the demand in several sectors, which may lead to an overproduction crisis, layoffs, and potentially a downturn. An answer to such objection is to point out that other sectors (e.g., construction, health, and education) will most likely experience an increase of demand. Thus, a reallocation of productive resources (capital and labor) across sectors could compensate the tax effects.

Nonetheless, it leaves open the question whether the increase of activity in some sectors will make for the full loss of demand in others. A further concern is whether the labor force will have versatile skills enough for being transferred to sometimes drastically different occupations. The concern could apply to capital too. A large amount of equipment and machines might not be usable in other industries. At the end, those are implementation questions of empirical nature that could only be answered by a proper impact study.

Another criticism centered on the consequences is to pinpoint the political risk of top-earners reducing their spending in favor of accumulating large capital. First of all, there is a chance that this will accentuate wealth inequalities, which have already been in the rise in many industrialized countries since the 1970s (Piketty 2014). There is also the risk that such accumulated capital starts being used for lobbying, influencing decision makers, or even fueling the shadow economy and corruption. Again, this is an empirical issue which is difficult, or even impossible, to settle beforehand.

Besides fiscal instruments, another regulatory response could be to constrain commercial publicity. Assuming that advertisement has a

significant influence on individuals, the argument is that, by restricting the advertisement, individuals will have fewer incentives to spend, so it will moderate conspicuous consumption, while not meddling in individuals' spending decision. The problem with this argument is that it relies on the assumption that publicity, and not interpersonal comparisons, is the main driver behind the consumption of positional goods. There are reasons for doubting such assumption, especially if the thesis is taken seriously that human brain is hard-wired for paying attention to relative standing.

A Threat to Subjective Well-Being?

Finally, the theme of conspicuous consumption taps into a broader issue: the apparent dissatisfaction with the capitalistic model of economic development. The Great Recession (2007–2008 crisis and the aftermath) has accentuated the trend, but for a couple of decades, voices have been rising for condemning excessive consumerism.

One early formulation of such discontent can be found in the report *The Limits to Growth* released by the Club of Rome in 1972. The happiness research has been reinforcing suspicions that a capitalistic model of growth based on mass production and consumption would actually not significantly improve quality of life in industrialized countries.

The Easterlin Paradox has been a key for supporting such concerns. Formulated by the American economist Richard A. Easterlin (1974), it articulates three propositions:

1. Within a given country, happiness (measured by life satisfaction) is correlated with wealth (measured by income).
2. When countries are compared, there is a correlation between happiness (measured by life satisfaction) and wealth (usually approximated by gross domestic product per capita) until a threshold after which happiness stops being significantly correlated with wealth.
3. Some longitudinal studies show the absence of significant increase in happiness (life satisfaction) for several decades in countries such as Japan or the USA.

A ready-made explanation for the Easterlin Paradox is that economic growth creates additional resources that are, after basic needs are covered, massively used for conspicuous reasons, which do not bring lasting satisfaction (on the top of generating stress and waste). Again, this point is empirical and cannot be resolved without solid studies. Furthermore, the Easterlin Paradox as well as the whole happiness research raises serious methodological issues about the collection and statistical treatment of data.

Notwithstanding the various controversies, conspicuous consumption and positional goods prompt crucial concerns not only about social dynamics and hierarchy, but human satisfaction and development too. They highlight how important are the topics of efficiency, equality, and life quality in industrialized countries – topics that will become increasingly important in the Anthropocene.

Summary

Conspicuous consumption refers to the consumption of goods and services motivated by relative standing, i.e., one's position in the distribution of income, status, prestige, occupations, or any other relevant dimension. This kind of consumption is aimed at signaling such a position. Conspicuous consumption challenges the postulate of traditional economy that individuals are mutually disinterested and derived their satisfaction only from absolute levels of consumption. Instead it depicts individuals motivated by interpersonal comparisons. Moreover, the analysis of conspicuous consumption underscores the adverse consequences that the consumption of positional goods could have, e.g., on life satisfaction, stress, or efficient allocation of resources. Several institutional responses have been proposed ranging from fiscal instruments (such as an incremental tax on consumption) to restrictions on commercial advertisements. Despite the controversies they generate, such responses underline the importance of issues such as efficiency, equality, and quality of life in industrialized societies.

Description

Despite the extensive debate as to what corporate social responsibility (CSR) is, consumer social responsibility (CnSR) has received very limited attention by researchers and practitioners (Quazi et al. 2016) and remains a term that is largely

unexplored and under-theorized (Vogel 2005; Caruana and Chatzidakis 2014). Very few of the many articles about CSR discuss the role of the consumer in achieving corporate social responsibility even though it will be difficult if not impossible for corporate social responsibility to succeed without the assistance of consumers (Vitell 2015).

In its broadest form, consumer social responsibility can be defined as “the conscious and deliberate choice to make certain consumption choices based on personal and moral beliefs” (Devinney et al. 2006). It mainly shows up in two different ways:

- Expressed activity with respect to specific causes (e.g., protests and demonstrations)
- Expressed activity in terms of purchasing (e.g., consumer boycotts or buycotts, ethical consumption)

Levels of consumer activism have been fueled by increased exposure to and accessibility of information about questionable business practices such as child labor, environmental pollution, or animal welfare abuse (Shaw et al. 2006).

Introduction

Much has been written on the business case for corporate responsibility. Unfortunately, a review of the evidence, including academic studies of the relationship between firm profitability and CSR, finds no evidence for the claim that there is a generic or universal business case for CSR. There is no automatism, and responsible company behavior does not automatically lead to increased company success. This, however, does not mean that there is no business case for CSR at all. As Vogel (2005, p. 45) has outlined, this “is rather to suggest that any such claim must be more nuanced. CSR does make business sense for some firms in specific circumstances.”

The business case is often grounded in the key assumption that consumers, employees, and investors care in ways that create economic incentives for companies to give attention to corporate responsibility (Smith 2007). The following parts

will discuss the role of consumers in CSR or, in other words, consumer social responsibility. The emphasis is on illustrating what research suggests are the conditions under which consumers might serve as drivers of corporate responsibility.

Protests and Demonstrations as a Form of Consumer Social Responsibility

The increasing number of protests and demonstrations directed at companies (particularly at large multinational corporations) is one way how consumer social responsibility is expressed. Protests and demonstrations invite consumers to join in collective action to send a message to companies. In earlier decades, consumers often took individual action in the form of phone calling and letter writing to protest against company behavior, but with the advancement of electronic information and communication technology came new ways of expressing and organizing protests (Kendall et al. 2007). Protests against the socially irresponsible behavior of companies are nowadays increasingly organized via digital media (van den Broek et al. 2017), and today, we often see consumers taking larger-scale, community-based action and making extensive use of the Internet to express their dissatisfaction with company behavior. Since firms can expect to suffer financial, reputational, and sales damage as a result of public protests and media exposure, this form of expressed consumer activism puts a lot of pressure on companies and can be seen as a driver of CSR (van den Broek et al. 2017; Vogel 2005).

Ethical Consumption as a Form of Consumer Social Responsibility

Every buyer (...) determines in some degree the direction of industry. The market is a democracy where every penny gives the right to vote. (Fetter 1911, p. 394)

The term “ethical consumer,” now used generically, was popularized by the UK magazine *Ethical Consumer*, first published in 1989 (Hunt

2018). Ethical consumption is most commonly defined as “the act of taking into account the public and societal consequences of one’s private decisions” (Strandvik et al. 2013, p. 484). It is another way how consumer social responsibility is expressed. Quite often, socially irresponsible company behavior leads not only to consumer protests but also to boycotts and buycotts, forms of ethical consumption. Ethical consumption (alternatively called ethical purchasing, moral purchasing, ethical sourcing, ethical shopping, or green consumerism) is a type of consumer activism that is based on the concept of dollar voting (Giesler and Veresiu 2014). It is practiced through “positive buying” in that ethical products are favored or “moral boycott” that is negative purchasing and company-based purchasing (Hunt 2018). In his 1998 published book *Unequal Freedoms: The Global Market As An Ethical System*, John McMurtry argued that all purchasing decisions imply some moral choice and that there is no purchasing that is not ultimately moral in nature (McMurtry 1998).

Boycotts

Consumer boycotts, defined as “an attempt by one or more parties to achieve certain objectives by urging individual consumers to refrain from making selected purchases in the marketplace” (Friedman 1985, p. 97), have a long and interesting history in consumer social responsibility, even if the term did not arise until the 1880s in England. By refusing to purchase products on a large-scale basis, consumers have an influence on corporate behavior and induce corporate change. From combating environmental pollution, the lack of minimum labor standards, lobbying, or misinformation campaigns to protecting animal rights, boycotts put economic pressure on some of the biggest companies to change their practices. They have seen repeated successes and continue to play an important role in consumer social responsibility. Examples of consumer boycotts are plenty. Some well-known ones are the boycott of BP after the Deepwater Horizon oil spill in the Gulf of Mexico in 2010, the boycott of Nestlé for their irresponsible marketing of baby milk formula since the 1970s, or

the recent boycott of Amazon over its outrageous tax avoidance.

Buycotts

Buycotts, on the other hand, “encourage people to purchase goods following an established set of criteria” (Micheletti 2003, p. 50). Quite often, such buycotts take the form of labeling schemes where groups of consumers or activists identify products that satisfy certain criteria (Kendall et al. 2007).

Areas of Concern and Impact

Consumers who are interested in ethical consumerism are mostly interested in company behavior in five main areas:

- Environment (e.g., environmental reporting, nuclear power, climate change, pollution, toxics, resources)
- People (e.g., human rights, workers’ rights, supply chain policy, irresponsible marketing)
- Animals (e.g., animal testing, factory farming)
- Politics (political activity, antisocial finance)
- Product sustainability (e.g., organic, fair trade, positive environmental features)

Survey data suggest that up to 90% of consumers consider corporate social responsibility in their individual purchase and consumption behavior (Vogel 2005). Even though research has shown that there is a huge gap between what consumers say they would do and their actual behavior, ethical consumption has become a routine part of shopping for consumers in many countries, and markets for organic, fair trade, and eco-labeled products have been growing for over a decade (Summers 2016). Therefore, ethical consumption is an important driver of CSR (Vogel 2005).

Summary

As the use and acceptance of corporate responsibility expand, it is becoming extremely important

for companies to have a socially conscious image. More and more consumers are beginning to prioritize CSR when choosing a brand or company, and therefore, being a responsible company can lead to competitive advantages and growth, while a company that is seen as irresponsible might be confronted with consumer protests or boycotts which could pose a threat to the survival of the company.

Consumer's Social Responsibility Communication (CNSRC)

Organizations, Collegium of Economy and Public
Administration, Cracow University of
Economics, Cracow, Poland

Synonyms

[Ethical consumptions](#)

Definition

Consumer's social responsibility communications (CNSRC) can be defined as the way consumers choose products/goods in accordance with ethical consumption. Consumer's social responsibility communications is also defined as a type of

relationship between enterprises and clients, in which clients express their requirements related to enterprises' socially responsible activities. Socially ethical consumer choices are becoming a requirement for enterprises and their operations (Cross-Reference: ► [“Consumer’s Social Responsibility Communication \(CNSRC\)”](#)). Consumers, through their purchases and consumption of products, are the final judges of corporations' behavior (Russell and Russell 2010). This concept is closely associated with consumer's social responsibility (CNSR). CNSR has been defined as the conscious and deliberate choice to make certain consumption choices based on personal and moral beliefs (Devinney et al. 2006). CNSR conceptualizes the “socially conscious consumer,” one of the stakeholder groups for enterprises, as a rational, individual decision-maker, motivated toward ethically augmented products (Caruana 2007). For this group of customers, ethical motivations play a key role in their decision-making process. CNSR is conceived here as the application of instrumental, relational, and moral logics by individual, group, corporate, and institutional agents seeking to influence a broad range of consumer-oriented responsibilities (Caruana and Chatzidakis 2013). Ethical consumption is defined by how material, goods, and services are used to provide consumers with a better quality of life while not degrading the environment or threatening the consumption of future generations (Szwajca 2018). Consumers with a high degree of ecological awareness (ecologically sensitive, eco-consumers) take measures to protect the environment by purchasing eco-products, avoiding non-biodegradable packaging, practicing waste segregation, and supporting green organizations and movements. In response to preferences of green buyers, companies expanded their market offer and introduced new product categories. Sen and Bhattacharya (2001) suggested that there are both company-specific and consumer-specific factors involved in the CNSR dynamic, where the major factor is consumer perception of the degree of congruence between themselves and the organization. Therefore, the CNSR dynamic is complex. Consumer engagement is embedded in cultural rationales (Devinney et al. 2006). Becker-Olsen et al. (2006) proposed that

consumer engagement with CSR is influenced by perceived fit (congruence of corporate mission and social initiative), perceived corporate motive (social centered versus profit-centered), and the timing of the communication (reactive vs proactive) with “fit” being considered as the perceived link between a cause and the firm's product line, brand image, position, and/or target market. To demonstrate the complexity of CNSR, Manning (2013) described the push-pull interaction mechanism between CSR and CNSR.

Conceptual Foundation

To understand the concept of consumer's social responsibility communications, it is necessary to refer to key concepts associated with it. The most important concepts are green consumption, sustainable consumption (customer perspective), and corporate social responsibility (enterprise perspective).

Green Consumption

Green consumption characterized consumers that “take into account the public consequences of his or her personal consumption and attempts to use his or her purchasing power to bring about social change” (Webster 1975, p. 188). Ecologically oriented buyers consciously choose “green” products. The following are some characteristics of green products described by Elkington et al. (1990):

- Does not threaten the health of people or animals.
- Should be environmentally friendly at any stage of its life, including manufacture, use, and disposal.
- Should be economical both in terms of energy consumption and use of other resources during manufacture, use, or disposal.
- Shouldn't cause waste associated with excessive packing or a short useful life.
- During its production, animals should not be used or abused.
- Shouldn't use materials derived from threatened species or environments.

Environmentally friendly consumption may be characterized as highly a complex form of consumer behavior, both intellectually and morally as well as in practice (Moisander 2007, p. 404). The demand for eco-friendly products is driven by consumer awareness about environment.

Sustainable Consumption

Trends, such as green growth and increased public awareness, change the perception of the world surrounding consumers. The concept highlights significant changes in the role of consumers as partners in the act of exchange and in their behavior in sustainable consumption (Cross-Reference: ► [“Sustainable Consumption”](#)). Contemporary consumerism in all its varieties, i.e., ecological, ethical, political, and consumerism, aims primarily at transforming the current consumption model into sustainable consumption in the economic, ecological, social, psychological, demographical, spatial, and temporal dimensions.

Consumers are treated as one of the company's stakeholder groups (Cross-Reference: ► [“Stakeholder Engagement”](#)). Freeman (1984, p. 26) defines stakeholder as any group or individual, who can affect or is affected by the achievement of the firm's objectives, and he suggests that there is a need for integrated approaches for dealing with multiple stakeholders on multiple issues. To analyze their behavior, stakeholder theory can be used (Cross-Reference: ► [“Stakeholder Theory”](#)). Andriof and Waddock (2002) underlines the importance of engaging stakeholders in long-term value creation. The emphasis is moved from a focus on stakeholders being managed by companies to a focus on the interaction that companies have with their stakeholders based on a relational and process-oriented view (Andriof and Waddock 2002, p. 19).

While consumers express the desire for information on firms' CSR records, the communication of CSR initiatives remains a challenge for the CSR marketing communicator. Morsing and Schultz (2008) find that consumers prefer CSR initiatives to be communicated through, i.e., annual reports and websites over the use of traditional communication channels.

Corporate social responsibility (CSR) is a management strategy, according to which companies in their activities voluntarily take into account social interests, environmental aspects, or relationships with various groups of stakeholders (Cross-Reference: ► [“Corporate Social Responsibility”](#)). The stakeholder theory underlies the concept of corporate social responsibility. According to this theory formulated by E. Freeman, the enterprise is a constellation of cooperation with him and competing stakeholders (Cross-Reference: ► [“Stakeholder Theory”](#)). Social responsibility includes investments in human resources, environmental protection, relations with the company's environment, and informing about these activities. These factors contribute to the increase of the company's competitiveness and shaping conditions for sustainable social and economic development. Corporate social responsibility is defined as a company's obligation to exert a positive impact and minimize its negative impact on society (Wagner et al. 2009).

Literature highlights positive effect of social responsibility on financial performance (Orlitzky et al. 2003; Marom 2006), consumer product responses (Pirsch et al. 2007), attitudes toward corporate and brand images (Webb and Mohr 1998), purchase intention (Smith and Alcorn 1991; Adkins 1999), as well as consumer-company identification (Sen and Bhattacharya 2001).

The involvement of enterprises in environmental protection, ethics issues, and solving social problems affects the level of identification of consumers with the enterprise, and their emotional relationship resulting from the acceptance of the same values determines their purchasing decisions and the degree of loyalty. As a result, consumer behavior sets the framework for the expected and accepted social commitment of enterprises.

Issues

Carroll's (1979) classic work on CSR highlights four types of social responsibilities, including

economic, legal, ethical, and philanthropic/discretionary. Aupperle et al. (1985, p. 458) emphasized primarily the legal, ethical, and philanthropic responsibilities as representing a firm's concern for society and argued that the social orientation of an organization can be appropriately assessed through the importance it places on the three non-economic components compared to the economic. Consumers care about transparency; hence making organizational transparency is an important factor in engaging stakeholders (including consumers).

Based on Grunig and Hunt's (1984) characterization of models of public relations, Morsing and Schultz (2008) unfold three types of stakeholder relations in terms of how companies strategically engage their stakeholders in CSR communication: the stakeholder information strategy; the stakeholder response strategy; and the stakeholder involvement strategy. A key challenge of CSR communication is generating favorable attributions that cover consumer's requirement. Ellen et al. (2006) found that most respondents gave mixed attributions and, interestingly, when CSR attributions were mixed, respondents' reactions to CSR were actually more positive than when attributions were purely intrinsic or extrinsic. Ellen et al.'s (2006) finding are also consistent with other research showing that stakeholders are often tolerant of extrinsic motives as long as CSR initiatives are attributed to intrinsic motives as well (Sen et al. 2006).

Social responsibility is an important motive that drives action and choices not only for consumers but also for companies. From this perspective, it is worth emphasizing that in 2010, the International Organization for Standardization developed the ISO 26000 standard (Cross-Reference: ► ["ISO 26000 STANDARD"](#)). This standard is intended as a guide for organizations in the application of the principles of social and environmental responsibility. "Guidance on social responsibility" defines social responsibility as the responsibility of an organization for the impact of its decisions and actions on society and the environment, through transparent and ethical

behavior in key areas, such as organizational order, human rights, work practices, environment, fair operating practices, consumer issues, social involvement, and local community development ([ISO 26000 Social Responsibility](#)). This standard is intended for all organizations and is not subject to certification; it is a set of practices and canons giving the possibility of their voluntary application by the organization. Any organization can use this standard if it complies with its principles.

Summary

Trends such as green growth and increased public awareness change the perception of the world by consumers. Well-informed customers expect suppliers' products not only to be of quality, valuable, and safe but also to take into account international quality standards, such as ecological products and packaging, interactive communication, and reliable, honest, and ethical advertising. Including the concept of corporate social responsibility in the practice of business operations reinforces the need to compete for consumers through justice, fairness, rights, virtue, and sustainability. Company-costumer relations require a social-moral relationship. From the perspective of consumer's social responsible communication, it would be interesting to understand what the interconnections between instrumental, relational, and moral motivations are. On the other hand, how do corporations respond to different pressures for CSR at the corporate-consumer interfaces in the context of their own range of motivations?

Synonyms

Consumer-centered strategies; Consumption crisis/critiques; Citizen/consumer shifts; Consumer experience; Resource depletion debates; Human-made waste/pollution; Output-focused economies; User activism; Social/commerce tensions; Use-goal utility; Tangible leisure attainment

Definition

There are two essential and opposing ways of looking at the long-contested subject of *consumerism*; a set of combined, context-dependent approaches have been emerging as sustainability discourses, management practices, and consumer behaviors had grown and developed over time.

Two very restricted opposing definitions may be offered at this point, before due elaboration ensues. The third may not (yet) be fully formulated at a level of definition:

First, as the practice of upholding the rights and enfranchisement of consumers – and the very notion of consumption as a doctrine fundamental to the conception of capitalist systems, especially in their advanced mass-market forms – understood to be sustaining, stimulating, promoting, and facilitating production, economic growth, prosperity and well-being (Which can be traced back to Adam Smith’s renowned postulates of causation of production in consumption. It is not the place of this elaboration to address such

fundamental concepts though they do require recognition. Indeed, it is equally important to refer to consumer cooperatives’ response to socioeconomic change which would later become reformulated among the ethical consumerist discourses (e.g. De Ugarte 2014).).

Second, the critique of modern cultural and societal fascination (The notions articulated as dependence (Galbraith 1998) and addiction (Room 2011) or habit (Eyal 2014).) with the perpetual consumption of goods, services, and – more recently – experiences and its arguably detrimental and alienating effect on human society, threatening its health, well-being, and the global environment.

The third (It is worth noting at this point that the three are presented in historical succession.) – nascent – concept may be addressing an emergent manner of the increasingly adopted practice of conscious and mindful utilization of goods and services in substantively rational (In the Weberian sense of “substantive rationality”; for further elaboration see Weber (2002).) and experientially purposeful ways: “Consumption activism as novel consumer sovereignty (A detailed elaboration of consumer sovereignty as posited by Mises, Hutt, and others, see Olsen (2019). Regarding the criticism of consumer (ethics) activism, see Hussain (2012)).”

The prevailing critical definition and use of the term *consumerism* emerged in 1960 at the height of consumer culture specifically in the United States. Marking the analytical change of direction in the early 1960s, this now pervasive meaning was first articulated in a seminal book by Vance Packard. Though not explicitly interested in academic work, nor labeling himself an environmentalist, Packard – journalist, public intellectual, and author of several influential tomes of astute social criticism – had nonetheless influenced sustainability and environmental thought (Having also addressed many other aspects of life in his critique of society, industry, and culture in affluent Western industrialized economies between the early 1960s and late 1980s.). The term *consumerism* had since been widely adopted in numerous treatises across the disciplines of social sciences, philosophy, culture, communications, (critical)

management analyses, and even engineering. The focus of this text will chiefly address critical takes on consumerism and its components.

Introduction with Developmental Conceptualizations of Critical Consumerism

Overall, opinions are divided as to the exact definition, meaning or esteem of “consumerism.” As for the means of defining the term, presenting various examples: Some of its advocates (e.g., Pirie 2012) refer to the 1915 entry of the Oxford English Dictionary (The critical insight on consumerism involves texts addressing very instrumental logics of engineering management such as those by El Hami et al. who state that the 1915 definition carries the literal meaning of what it entails to “consume”; they provide perceptive context as to its subsequent redefinitions of “a real ideology where the consumption of goods is of capital importance, a phenomenon that continues up to excess” (2017: 6). Reeves (2013: 66) sheds added light on the original use of the phrase: The term “consumerist” originally came to mean consumption in the context of customer rights and “advocacy of the rights and interests of consumers,” claiming its real modern meaning to have emerged in the 1960s, as per the impact of Packard’s work (though not directly referred to in this explanation).). Other, more critical sources (Intriguingly, all of the sources referring to Veblen above belong to the realm of evolutionary psychology.) trace the term to Veblen’s influential tome of 1899 (e.g., Burkeman 2009; Sundie et al. 2011) – though *the term itself* does not figure as such, some core elements of its modern meaning are identifiable. Historical, revisionist works tend to look at consumerism in ancient times and identify certain models and behaviors traceable to the Roman Empire, and before (e.g., Walsh 2013; Greene 2008); other, supportive interpretations of consumerism align it with the positive contributions of capitalism and its connotations as expressed by a leading automotive executive in 1955 (In addition to the exploration of the use of

the term by a Ford Vice President in 1955, Gurney (2017: 3-4) also provides an overview of the neo-liberal turn toward the widespread adoption consumerist culture in the 1980s following a previously critical take on the matter; e.g., in public services where “passengers” in public transport announcements and “patients” in healthcare contexts would become labeled “customers.”) (e.g., as cited in the critical overview of post-WW II consumerism by Whiteley (1987)). The latter term (Quite literally, “Fordist,” owing to the sources of its origin.) designates economic conditions, industrial practice, and human behaviors alike.

The authors also tend to demonstrate either very positive or equally negative implications when discussing *consumerism*. Notions covered include environmental harm, waste, planned and/or engineered obsolescence, addiction, mental health issues, social stratification and damage to the social fabric, and even crime. Also, conversely, those of progress, innovation, economic growth, enterprise and empowerment, social advancement, open market competition, freedom of choice, and user emancipation – all those varied and often contradictory perceptions and elaborations accompany the term. Pragmatic critical approaches tend to look at consumer activism, political or ethical connotations, involvement in environmental or health-promoting causes (It should be noted that the role and involvement of consumers who self-identify as conscientious, engaged, and ethics is itself criticized within the context of proclaimed assertions vs. impact, i.e., words vs. action.), and such like.

While this entry affords due attention to free market approaches, it is necessary to clearly acknowledge the critical origins of the modern-day use of the term *consumerism*. The matters of particular importance in this instance would be those relating to environmental and social sustainability and means by which consumers as citizens – or citizens as consumers (See terminological – and policy critique: e.g., Livingstone et al. (2007). Not to be confused with Mises’/Hutt’s notion of consumer sovereignty; however, nuanced connections do exist.) – act

to take claim of their rights and responsibilities in an active manner within the scope of market economy.

There are other positively intoned approaches to consumerism. Those tend to address the perceived awakening of consumers as to their social role and impact, and a growing number of consumer groups and movements aimed at the proactive enactment of positive, sustainably conscious sociocultural change in consumption behavior patterns. The journey toward a culture of consumption and consumption as a force of identity and culture formation is arguably making full circle with large-scale behavioral changes recorded in recent decades. This, namely, is arising from and chiefly present in developed western postindustrial economies. The aspirational aspects of consumerism appear to capture the imagination of the rising and growing middle classes of “emerging economies,” i.e., those production giants where most of the Western corporations’ manufacturing base is outsourced, more resembling a similar consumer optimism of Western consumers in the post-war reconstruction period from the 1950s (The matter of outsourcing and global production and supply structures may yet become debatable in the wake of the COVID-19 pandemic. Also, though Paek and Pan (2004) speak of a mainstream predilection for consumerism, Zhu and Sarkis (2016) address the matter of environmental consumerism on the rise in China.).

At the peak of that era of Western trends of consumer optimism and outpourings of American industrial goods mass production appeared the key book by Packard, “*Waste Makers*” (1960), producing the impactful work of critical analysis that largely defines consumerism in its enduringly contemporary meaning. J K Galbraith’s matter-of-fact analysis *The Affluent Society* from 1998, with a chapter on “dependence effect” is of particular relevance to critical views of consumerism as an innately unstable self-perpetuating cycle of self-causality:

The higher level of production has, merely, a high level of want creation necessitating a higher level of want satisfaction. (Galbraith 1998: 127)

The notion of dependence (even addiction as will be seen below) are fundamentally related to many expositions on consumerism. Packard’s metaphorical Cornucopia City is the site of improvidence and symbolic extrapolation of *positive feedback loops* in consumption and planned obsolescence, thus forming a negative utopia. The two works, though different in style and tone, appear to have sought a moderating approach that mitigates market excess and addresses the then core extant notions of value, e.g., infrastructure and education (As such, they are opposed to what would morph into the neoliberal doctrines akin to consumer sovereignty.). With the spread of neoliberal (This complex term of central importance is too demanding to be attended to in this text.) thought into policy and practice, deregulation, privatization of the public sphere, and an increasing role of media, advertising, marketing, and PR within societal constructs widely adopted, the critical thought of such works had no longer found an institutional basis in civil society.

Another critical text worthy of special attention was Marcuse’s *One-Dimensional Man (Not without criticism, e.g., from feminist views holding against omitted notions pervasive gender dominance.)* (1964). Marcuse discusses the “flattening of discourse” in liberal contexts where consumption adopts a social function and leads to a resultant passivity of contradictions defused and channeled by becoming seemingly reconciled and fed through the liberal media and consumption conduits. As envisaged by Marcuse and other precursors of the “new left,” the grounds of social dialogue soon shifted into matters identifiable with previous niche discourses and oft-marginalized rights contestations. Such contestations, consensus rethinks, and substantive rationality discourses had become the platform for societal dialogue in the wake of the neoliberal turn; as such, it had allowed for public debate within its broadly market-formulated scope which left room for diversity. Value/values rationality thus adopted a new form, that of substantively rational – less so structurally instrumental – goals informed by the preservation of the habitat, rights activism, and the legacy of cooperative

approaches (Traceable back to the eighteenth century.), all of which had tasked their participants to carry out the form of then new ethical and/or political consumerism (e.g., Clarke 2008).

Owing to normative transformations of societies on a worldwide scale, and fundamentally influenced by globalization (especially its economic and multinational corporate features), civil society negotiation by sector and cause and fragmented consensus-building had replaced prior, frontally oppositional doctrines. In such contexts, critical works akin to those of Galbraith and Packard retained some explicatory potential. Especially in an environmental context, the practice of *planned (engineered) obsolescence* is central to Packard's 1960 volume. This highly developed concept is well-covered in sustainability literature (e.g., Maycroft 2009; Wieser 2016). As such, it acts as the dependence-forming vehicle necessary for continued flow of consumption (Ever more sophisticated tools and methodologies are in use in the early twenty-first century (see Eyal, 2014)).

Consumption, Dependence, Habits, and Addictions

Critical judgments of consumerism continue to relate to forms of dependency beyond the formulations offered by the authors cited above.

Some illustrations concerning *addiction*: Supporting the claim of innate inconsistency of everyday consumerist ethics, Room (2011) analyses the contradictions between neoliberal "consumer sovereignty" concept and its extensions represented in the phenomenon of *alcohol marketing* (e.g., advertising, round-the-clock availability, and "the moderate drinker ideal") against the backdrop of requirements for sobriety in regular tasks around everyday life. Room (2011: 6) notes that:

The moderate drinker, who drinks regularly, but without ever becoming intoxicated, is thus a hero of the economic system, painstakingly treading the knife-edge between failure to consume and overconsumption.

and

Putting the blame on the individual level provides a solution to the contradictions of a system built both around expectations of sober attention and around a relatively free availability of alcohol. (Room 2011: 7)

Elsewhere, Reith (2004) points at the "discursive convergence" and internal conflicts of cultural drives toward compulsive behavior and self-control in neoliberal consumerist societies where freedom, as contrasted with determinism and addiction, appears to be proliferated through the neoliberal constructs such as *freedom to choose* (Milton Friedman's own term.) and collectively sanctioned embodiments of consumer autonomy. Using key, yet peripheral, examples of addiction discourse's connection to *substances and activities such as tobacco, caffeine, and shopping* (2004: 288), as well as the medical *focus on the body of the user* (2004: 291), Reith posits the co-opting of such "deviant" meaning outside the normative impact of neoliberal discourse and the blame apportioning toward users (Social, hereditary, and community-bound connotations of such users form an integral part of her analysis.).

A seasoned practitioner in device-driven and cognitively informed marketing, Eyal (2014) distances himself from addiction as such. In a highly articulate and practice-focused book, remarkably and aptly titled *Hooked*, he leads the reader through the reasoning, (elements of) science, and features of device-focused technology behind the design and implementation principles of leading *habit-forming products* (the term appears in the book's subtitle). A frank and candid elaboration on the practice some would find ethically dubious but few would dispute its effectiveness, *Hooked* provides the reader with direct insight into consumerist-advancing blends of technology and psychosocial innovation underpinning the ubiquitous digital devices of the early twenty-first century. Further permeating everyday life and affecting regular communications, entertainment, and time-focused attention-driven media, such devices and myriad platforms designed for them bring consumption and intuitive market research into the space of individual privacy, intimacy, and personal routine. As elaborated by Jaakkola (2020) and Hill (2011), among others: The most

ethically problematic aspect of such permeating impact on any part of the broadest human community is that on children, proven to be affected by consumerist habit formation. It is the ultimate sustainability of our species – that of the plausible survival, mental, and physical well-being of the next generation of human life (This is where few would disagree that identity constructs play a major role.).

Hyper-consumption, the Environment, and the Ethical Consumer Movement

In an interview with London's *The Independent* (*The text also reveals elements of the cultural shift that also helped articulate shopping as a preferred pastime of "late modernity"; arguably, this may be traced to the beginnings of PR in the early twentieth century.*), author Benjamin Barber states:

"Over a billion people are without drinking water," says Barber. "Why don't we find out ways to get the water they need to them, instead of new ways of getting water to us?" (Morris and Barber 2008)

Ethical discourses play a central role in consumer activism.

This entry presents a minute sample of such work. Once more, opinions are divided.

While some (e.g., Akenji 2014; Hussain 2012) observe problematic, partisan (Akenji observes the practices mainly aimed at businesses; Hussain recounts the politics of consumption and identifies the American Colonies' rejection of the British 1756 Stamp Act as an early example of such practice.) components within the doctrines and practices of ethical consumerism, the vast majority of authors across different sectors and outside the academe tend to explore its contribution, lending it their judicious support.

For example, Sachdeva et al. (2015) explore green consumerism across the factors of values, identity, and social norms; expectations and connotations; and structural factors and impact, while Moisander (2007) seeks to acquit individual

consumers of the burden of environmental responsibility, echoing somewhat the concerns over deontological bias regarding individual agency and action as per above and seeking a set of systemic solutions instead. Elsewhere, Thompson and Coskuner-Balli (2007) conducted a detailed fieldwork study examining the linkages between belief systems and normative codes (of substantive/value rationality) adopted for the sake of developing and enhancing community supported agriculture and their practical impact on the organization and business of it. Relatedly, authors such as Copeland (2014) explored value change in postmaterialist political consumerism, seeking to connect it to other forms of political behavior. The influential work of Smith (e.g., 2007) connects ethical consumerism and corporate social responsibility on structural and mutually causative levels, arguing that ethical consumerism forms a prime case for CSR.

Scrutinizing the ethical consumerist discourse and practice, however, contributes to the construct validity of the entire field in terms of practice and of analysis, theorization, and methodology alike. Thus, for example, Auger and Devinney (2007) examine the data reliability of consumer surveys in categories of socially or ethically responsible behavior, proposing a more accurate yardstick and refined test/control group connections. Another significant example: Carrington et al. (2010) similarly identify a notable gap between professed and stated preferences of ethical intentions and manifest behavior, along the insights of *implementation intentions, actual behavioral control, and situational context* to form a *holistic conceptual gap* between stated intentions and actual behavior among ethically minded consumers. Weaver's 2019 critique of *consumer activism as economic democracy* explores the discerning inspection of the practice and its postulates from the viewpoints of multiple doctrines and pragmatic processes, while also working to uncover innate built-in conceptual preferences in consumer sovereignty notions and feeding insights back in to the field.

Feedback Loops of Present-as-Future

In the dynamic category of *consumerism*, especially in *ethical terms*, it is important to note the *evidential effects* of economic, social, and cultural change. The theme of *alienation* persists: The impact of neoliberal logic, doctrine, and globally pervasive practice has resulted in extensive cultural changes since such effects were first felt. The shift from citizen to consumer and from community member to autonomous agent of choice had marked the post-1979 era. Arguably (A city broker identified the 2011 UK riots as consumerism-oriented; branded goods were looted, and cheaper products destroyed by the mob (e.g., Hawkes 2011).), this led to the diminishing role of broader societal cohesion (as referred to above, e.g., Gurney 2017: 3-4). The COVID-19 pandemic seems to have delivered (The global pandemic is still affecting the world at the time of writing.) examples of further voracity and alienation (“... When we talk about extreme overstocking behaviour, that is problematic’ said marketing researcher”) (Rodriguez 2020) – as well as some positive change (Thought-provoking balance of “health-as-luxury” against the backdrop the luxury of ‘life’s simple pleasures.’) – across the world (Achim 2020). As novel market uncertainty is being built into the “new normal” (a term entering the mainstream) – *social distancing* is being identified as a factor affecting brands, should its effects be felt long term. Cultural change may regardless of global health tremors relate to the behavioral generation gap already widening in advance of it; Canavan (2019) reports the *millennial* distaste for physical outlets. The present is by definition in a state of flux. What trends may emerge depends on such flux.

Summary

Consumerism remains a highly charged and changing, evolving concept. By definition, it is rooted in the notions that come as close as possible to sustainability in ethics and practice. It is a

fact of advanced capitalism, and while in the West it is very much about conscious consumption and citizen responsibility, in the emerging economic powerhouses of today, it largely takes the original form of conspicuous consumption. Whether one adopts Veblen’s approach or Ford executive pragmatism; Packard’s nascent and thus deeply influential criticism; a religious, or conversely, social (ist) values critique either ideologically burdened as in the old, or cynically elaborate as in the works of a new left following in Marcuse’s work – consumerism tends to generate discourse, in its multitude and diversity, engaging a variety of schools of thought around social norms and problems. Indeed, one’s stance toward consumerism is not just outward signifying practice of a discourse: it is an agent of definition of that very approach and worldview. The modern, engaged consumers often see themselves as activists of ethical consumption, not merely of a utility or of an aesthetic branding laden with meaning, but both. It is not lost, however, on the critics of activist/citizen-consumer thought, that it tends to be extreme and/or ineffective: in some cases, critics point out that consumer activism can be overimpassioned; in others, that there is a consistency gap between the proclaimed and the actual behavior on display. Where such approaches seem best effective is in the fields of community-centered practice of production-meets-consumption, such as in small-scale growing of crops and health foods. The environmental aspect of consumerism is clearly a hallmark of its modern-day meaning, whereby “modern” encompasses even the very early works of Veblen or of Weber, in his elaboration of values-based thought. The underlying principles of consumption articulated by Smith in the eighteenth century remain fundamental to the notion of exchange value which stands at the heart of a (post)industrial society, regardless of ideological precursors: both Marxian and neoliberal approaches to consumption are bound by the notion of an exchange values-driven society. Therefore, leisure and consumption remain intricately related to one another and to labor, surplus value, and numerous other weighty and charged

concepts. This appears that only communities-led approaches to production-consumption circuits seem to stand outside such reckonings, though they do remain untested on any replicable large-scale sampling as exceptions to the organized norm since at least the advanced stages of the industrial revolution.

Definition/Description

Leadership can be characterized as a human-centered system that responds to all internal and external factors that impact it. Modern business organizations are under the influence of many volatile, uncertain, complex, and ambiguous (VUCA) factors. Contingency theory is considered as one way of assessing organization and leadership action, supported by various empirical research that observes leaders' styles concerning specific situations (Northouse, 2013), whereas organizational effectiveness is deemed because of specific organizational characteristics and contingencies (Donaldson, 2001). Contingency theory is based on the belief that the environment a company operates severely affects the appropriate way a firm should organize to be more effective (Betts, 2003). According to Chenhall (2003, p. 191 as cited in Otley, 2016), "term contingency means that something is true only under specified conditions." Contingency theory depends (is contingent) on a variety of factors, including the environment, technology, size of the organization, number of employees, company culture, and a range of products (Betts, 2003; Heery & Noon, 2008).

Introduction

The importance of studying the environmental influence on business organizations became a trend in the 1960s after the development of open-systems theory and contingency theory when researchers went beyond organizational boundaries to realize the scope of managerial influence. They tried to find out how business leaders perceive and influence the organizational relationship with different factors that are shaping their business environment. An organizational environment is a cluster of forces and conditions that operates outside of the organization but affect its reality and the manager's ability to engage and utilize resources. From the organizational perspective, it all started through the work of Burns and Stalker (1961), who used the organizational contingencies theory to identify a crucial link between organizational structure and context to develop models of organizational structure that can be modified to fit various types of environments.

As Valeri (2021) wrote, the general rule here is that the organization should develop its level of specialization so that single parts interact with specific environmental factors to guarantee compliance with the principle concerning the rate of adaption of an organizational structure, which corresponds to the rate of change of the environment it works in. Since the environment in which organizations operates is in constant flux, Burrell and Morgan stated that contingency theory enables different proper responses to changes in the environment (Lagstedt & Dahlberg, 2018). Contingency theory is based on the notion that an adequate "fit" between organizational parameters and contingency variables leads to enhanced performance (Betts, 2003). Contingency theory is situation-specific by definition, whereas specific authors believe that even though there is no single preferred management approach and way of decision making, the organization should align with the environmental conditions, while authors with different views believe that organization can influence and adjust the environmental conditions (Heery & Noon, 2008).

Some authors believe there is a distinction between structural and strategic contingency theory (Betts, 2003). Structural contingency theory first appeared in 1958 through Joan Woodward's work, in which "the contingency equation" was mentioned which posits that the alignment among structural features and production improves a company's performance (Shenkar & Ellis, 2021). Structural contingency theory is less in scholars' focus than in previous decades, which is observable by several papers published in leading management journals, where a sharp decline is visible in the mid-1990s and with very few articles published in the discipline afterward (Shenkar & Ellis, 2021).

Fred Fiedler and his associates developed the most prominent and influential contingency theory approach (Ayman et al., 1995; Northouse, 2013). In the past, organizational research attempts were made to find the most appropriate style of leadership and management behavior, where a leader can learn how to adapt leadership style to various new situations, whereas the contingency view sees an organization's success as matching the leader's motivational structure and control (evaluated with LPC – least preferred coworker scale) with impact on the situation (Leister et al., 1977). Fiedler posited that there is more than one style of leadership, where the best fit depends on the situation (Verkerk, 1990). The closer the fit, the better the effectiveness (Northouse, 2013). Other authors also researched contingent leadership behavior, and one common denominator is focused on completing activities instead of focusing on leaders working with people (Verkerk, 1990).

Contingency Approaches

Several contingency approaches exist in the literature, ranging from qualitative to quantitative (Luthans & Stewart, 1977). The contingency approach aims to establish connections among environmental, managerial, and performance variables, where various approaches include: organization design, leadership, behavioral use, and quantitative use (Luthans & Stewart, 1977).

Stemming from general organizational contingency theory, besides the field of management (Betts, 2003) and leadership, contingency approaches were explored and used in various areas such as risk management (Collier & Woods, 2011; Silva & Francisco, 2019); innovation management (Chesbrough, 2020); supply chain risk management (Grötsch et al., 2013); organizational change (Batillana & Tiziana, 2012); operations management (Sousa & Voss, 2008); project management (Howell et al., 2010); management control systems (Otley, 1980; Chenhall, 2003); management accounting (Otley, 2016); as well as other areas of research and application.

Fiedler's Contingency Theory

According to Fiedler, the contingency theory of management states that leaders attempt to adjust the appropriate leadership style to the specific situation that will drive them to accomplish the organizational purpose (Northouse, 2013). Core aspects of Fiedler's contingency model are situational favorableness (leader's control and influence) and leadership style (as measured by the LPC scale) (Fiedler, 1972, p. 453). Furthermore, leadership styles can be task motivated (reaching a goal) or relationship-motivated (forming close interpersonal relationships), where leadership styles can be measured with the LPC scale (employee with whom the leader least likes working), where high scores indicate relationship motivated (close interpersonal relations and group support), while low scores indicate task motivated (prefer specific evidence of accomplishments) (Leister et al., 1977; Northouse, 2013). In literature, the LPC score that measured leadership style with scales was often presented with 16–22 bipolar items (that describe the least preferred coworker in opposing adjectives, e.g., pleasant as opposed to unpleasant) and calculated as a sum of ratings (Mitchell et al., 1970; Ayman et al., 1995).

According to contingency theory and different leadership styles, task-motivated leaders are

effective in very positive and very negative situations (crises or poor performance), whereas relationship-motivated leaders are effective in certain situations (not fully controllable or, on the other hand, crisis situations) (Ayman et al., 1995; Northouse, 2013). When the situation is determined and the appropriate leadership style is considered, the leader's appropriateness for handling the specific case can be determined (Northouse, 2013). As Fiedler proposed, depending on the situation, various leaders can be more or less successful in dealing with situations, whereas the LPC score is primarily determined by personality and its flexibility to change in time or by modifying the favorableness of the situation (Fiedler, 1972).

Contingency theory and a leader's control and influence can be established and measured through situational factors: "leader-member relations, task structure, and position power" (Leister et al., 1977, p. 465). Through dichotomies, dimensions can be observed as "good vs. poor leader-member relations, structured vs. unstructured tasks, and strong vs. weak position power," whereas, from the stated possibilities, the most preferred are good leader-employee relations, with simultaneously structured tasks and strong position power (Jago, 1982, p. 323).

Situational Leadership Theory

Situational leadership theory, or Hersey and Blanchard's theory, is based on the presumption that effective leaders modify leadership styles regarding ongoing situations (Graeff, 1997). The approach advocates the need for a suitable match of two essential elements: leadership style and follower's maturity (Blake & Mouton, 1982).

The theory recognizes four leadership style approaches (Hersey & Blanchard, 1977):

- Style 1 is called directing, guiding, or telling leadership style, in which the leader is very directive and authoritative, while the level of supportive behavior toward followers is low.

- Style 2 is called coaching, selling, or explaining leadership style, in which the level of the directive behavior of the leader is high, and the level of supportive behavior toward followers is high.
- Style 3 is called supportive, participating, or facilitating leadership style, in which the level of supportive behavior of the leader toward followers is high, and the level of directive behavior of the leader is low. A leader is more democratic and works with followers.
- Style 4 is called delegating, monitoring, or empowering leadership style, in which the leader delegates decision-making responsibility to followers.

On the other hand, there are also four levels of follower's maturity (Blake & Mouton, 1982):

- M1 is defined by followers' low competence, commitment, and confidence.
- M2 is defined by followers' low competence and high commitment and confidence.
- M3 is defined by followers' high competence and low commitment and confidence.
- M4 is defined by followers' high competence, commitment, and confidence.

Figure 1 shows that each of the leadership styles is suitable for one of the follower's maturity level (Hersey & Blanchard, 1988).

Path-Goal Theory

In this theory, leadership style or path changes according to a person's situation (Northouse, 2013). Leaders adopt a path based on the situation trying to achieve a goal, and as a result, a leader is more involved in the process (House & Mitchell, 1974). A leader's primary purpose is to show the followers the right path that will lead to the fulfillment of an organizational goal. Leaders empower followers, leading to a more significant level of efficiency and productivity.

Figure 2 shows that leaders' effectiveness depends on the employee and environmental

Contingency Theory,

Fig. 1 Matching leadership/followership styles

Contingency Theory, Fig. 2 Path-goal theory of leadership

factors and particular leadership styles (Stogdill, 1974).

According to the Path-goal theory, four leadership styles exist (Mango, 2018):

- Directive or task-oriented leadership style in which the leader gives followers guidelines

about tasks, makes standards for performance and controls behavior when standards are not satisfied.

- A supportive or people-oriented leadership style in which the leader is empathetic, and supportive results in better employee engagement and job satisfaction.

- Participative leadership style in which the leader works collaboratively with followers regarding crucial business decisions, ideas, and strategies.
- The achievement-oriented or goal-setting leadership style is when the leader sets ambitious goals for followers to boost motivation and strive for excellence in the organization.

The Decision-Making Theory

Decision-making theory, or the Vroom-Yetton contingency model, puts the leader's decision-making process at the center of the leader's attention. It is designed to help the leader recognize the most suitable decision-making approach and leadership style in an ongoing situation (Vroom & Yetton, 1973). The model examines three factors (decision quality, team commitment, and time constraints) located in a decision tree. A leader should answer seven questions to find the best decision-making process for ongoing situations (Vroom & Jago, 1978).

Decision-making theory portrays five decision-making processes (Vroom & Jago, 1988):

- Autocratic model (A1), a leader decides based on existing information without any consultation with followers.
 - Autocratic model (A2), a leader consults with followers regarding specific information and then decides.
 - Consultative model (C1), a leader consults with each follower individually (without a team synergy effect) and then decides.
 - Consultative model (C2), a leader holds team meetings regularly with followers and then makes decisions.
 - Collaborative model (G2), a leader is a moderator on a journey in which followers try to find a decision they all agree on.
- focuses on a leader's style and related success in a specific situation, and does not expect that every leader is capable of handling various conditions, which is a different approach compared to the trait approach to leadership (Northouse, 2013). Furthermore, the LPC questionnaire allows a multi-level analysis of relations between leaders and employees that can be used for leadership training and also the development of employees, and adjustments in existing ways of conducting work (Ayman et al., 1995). Contingency theory can be applied in organizations to evaluate and clarify why certain employees are effective in specific positions and situations while not so good in others (Northouse, 2013). In addition, contingency theory relationships are considered relatively simple to understand compared to other theories and can enable simple decision-making rules that affect the results of an organization (Betts, 2003).
- During the past decades since the emergence of contingency theory, there have been significant findings concerning the theory, where empirical research found that it is not feasible for organizations to cover all various contingencies it faces with adequate approaches (Otley, 2016).
- Criticism of contingency theory involves the following (Northouse, 2013):
- It does not completely shed light on why one category of leaders (task-oriented or relationship-oriented) is more suitable in certain situations than the other.
 - Certain researchers criticize the least preferred coworker (LPC) scale for its absence of face validity, unclear instructions, and challenges of use in organizations.
 - It does not fully elaborate on how the organizations should act when leaders' style does not match the situation or how to accommodate leadership style.

Strengths and Weaknesses of Contingency Theory

Strengths of contingency theory are that it is grounded in research, has a predictive approach,

Also, the organizational fit notion is only sometimes, especially in situations with more than one contingency scenario, where it poses a challenge as to how to apply the theory in such cases (Betts, 2003).

Considering all the advantages and limitations of contingency theory which deals with leadership effectiveness, it provides a basis for a successful framework for linking leadership styles with situations (Northouse, 2013).

Contingency Theory and the Workplace

Contingency theory advocates a non-general or identical style of leadership. Effective leaders apply appropriate leadership styles under the specific situation and followers (Gill, 2011). There are a lot of diverse factors that influence leader effectiveness in the workplace. These are workforce, corporate culture and climate, team size, task structure, management style, work schedule, work style and follower morale, and company policy (Bass & Stedlmeier, 1999). Each with a different leadership style, leaders respond to this diverse factor in a non-identical way. Leaders must always be aware that their success depends on myriad factors surrounding the organization and its followers (Northouse, 2013). Contingency theory leaders know the means of implementing diverse leadership styles in various situations regarding the fact that if one thing worked in the past, there is no guarantee that it will work again because of the different factors (Kriger & Seng, 2005).

Ethics in Contingency Theory

One of the challenges modern organizations have to deal with is leadership with deeper meaning, both for leaders and followers (Kriger & Seng, 2005). Today, it is inevitable that leadership has a moral dimension in an organization because it carries enormous ethical responsibility (Northouse, 2013). It is often compared that the leader's actions and behavior are just the tips of an iceberg, while feelings, thoughts, and intuitions shape a leadership style and influence followers (Badaracco, 2002). Applying the contingency theory in leadership means that leaders, through their power and influence, try to create an ethical and well-being climate for an organization (Kriger &

Malan, 1993). There are six factors of crucial importance in building ethical leadership (Northouse, 2018): character, action, goal, honesty, power, and values of the leader. Character defines the leader as a person, while actions refer to showing respect and justice to followers and empowering diversity in the workplace through leaders' strong core values (Kriger & Hanson, 1999). By selecting purposeful, critical, and worthwhile goals, the leader promotes positive values in the organization (Northouse, 2013). If a leader is not honest with himself/herself and followers and if he/she does not use the power of influence for the common good, he/she is not an ethical leader. Applying ethical contingency theory in an organization means that a leader is aware of who is he/she as a person, what the values are to promote in the organization, and how is he/she going to use his/hers power on followers (Northouse, 2018).

Corporate Social Responsibility and Contingency Theory

Responsibility is a necessary component for a leader's effectiveness (Waldman & Galvin, 2008). In the VUCA world, the lack of a leader's responsibility can cause ethical blindness in followers, leading to crises of legitimacy and trust in the organization (Maak & Pless, 2006). Responsible leadership is described as making sustainable decisions to achieve mutual benefits for internal and external stakeholders (Maak, 2007). It is recognized as more effective and influential than any other leadership style, with great potential to boost organizational performance and be a powerful source for innovative behavior of followers (Voegtlin et al., 2020). In responsible leadership, the leader shares their values regarding concern for the environment with internal and external stakeholders who desire to influence welfare improvement (Shen & Zhu, 2011). Contingency theory argues that there is no best set of corporate social responsibility initiatives for boosting organizational benefits because they depend on the situation in an organization (Javed et al., 2020).

Summary

In short, the contingency theory posits that there is no one-size-fits-all approach to leadership and that the most effective leadership style depends on the specific situation. Fiedler's contingency theory is a well-known management model that posits that a leader's effectiveness is contingent upon the leader's interaction style and situation. The theory has several advantages, including its relative simplicity and empirical evidence supporting it. However, one of its main shortcomings is that it needs to provide the best fit in situations with multiple contingencies. More recently, the theory has been applied in an attempt to improve ethical and moral standards within an organization by promoting responsibility among leaders and positive influence over followers.

Definition

Control-enhancing mechanisms (also called CEMs) identify the governance devices responsible for increasing the corporate control (Lin 2017; Saggese et al. 2016). Such mechanisms foster the deviation from the proportionality principle (i.e., “one share-one vote” rule – OSOV rule) between cash flow rights and voting rights (Adams and Ferreira 2008; Burkart and Lee 2008; Grossman and Hart 1988) and concentrate the firm control in the hands of a limited group of shareholders (i.e., blockholders/majority shareholders) (Deminor Rating 2005; Institutional Shareholder Services 2007).

It is worth noting that the proportionality principle postulates that one share should imply the right to exercise one vote in order to allow the effective allocation of company resources by properly aligning ownership rights and risks to investors (Adams and Ferreira 2008; Burkart and Lee 2008; Grossman and Hart 1988). Nevertheless, in firms characterized by CEMs, the diversion from this rule hampers the efficiency of the market for corporate control (Cuomo et al. 2012) and leads to identify two groups of shareholders with differential ownership rights (OECD Steering Group on Corporate Governance 2007). As a result, the presence of CEMs arises strong agency costs (Fama and Jensen 1983; Jensen and Meckling 1976; La Porta et al. 1999) since the disproportional ownership due to the use of these devices exacerbates the misalignment between the interests of blockholders and minority shareholders (Saggese 2018).

On the basis of these premises, the chapter provides an overview on control-enhancing mechanisms and sheds light on the issues raised by the related adoption.

What We Know and What We Have Learned on CEMs

Control-enhancing mechanisms can be classified in some categories. A first group comprises the devices able to enhance the blockholders’ control by leveraging the voting power (e.g., pyramidal

structures). A second cluster consists of CEMs that lock-in the company control (e.g., priority shares, depository certificates, voting right ceilings, ownership ceilings, and supermajority provisions), while another group includes the mechanisms that play as coordination devices (e.g., voting trusts). Finally, a last cluster encompasses the disproportional ownership mechanisms able to separate the company ownership from its control by leveraging the legal structures of the firm (e.g., partnerships limited by shares) or exploiting privatization processes (e.g., golden shares) (Burkart and Lee 2008; Institutional Shareholder Services 2007).

In this regard, a fruitful stream of research has mainly examined pyramidal structures (Almeida and Wolfenzon 2006a, b), voting trusts (Gianfrate 2007), golden shares (Bel and Trillas 2005; Boubakri et al. 2009; Hanousek et al. 2007), cross ownership (Bebchuk et al. 2000; Chapelle and Szafarz 2005), non-voting shares, and dual class shares (Nicodano 1998; Ødegaard 2007). However, less attention has been devoted to depository certificates, voting right ceilings, ownership ceilings, supermajority provisions, and partnership limited by shares as consequence of the limited use of such control-enhancing mechanisms (Institutional Shareholder Services 2007).

Overall, the latest debate on CEMs has emerged when the studies on ownership structures have started to focus on the separation between ownership and control due to the diversion from the proportionality principle. Since then, the interest of practitioners and academics has grown significantly (Saggese et al. 2016). In particular, it has steadily boosted after the wave of scandals that in the past decades has increased the pressures toward effective policy-making interventions aiming to improve the protection of minority interests. Indeed, CEMs have attracted the policy-makers' attention especially during the recent wave of reforms of financial market regulations and the harmonization process of the European commercial law (Allen et al. 2017; Cuomo et al. 2012; Saggese et al. 2016; Saggese 2018). Moreover, the debate on CEMs has been strongly prompted by the reports on the takeover bids

(Winter et al. 2002) and the application of the one share-one vote rule in Europe (Deminor Rating 2005; Institutional Shareholder Services 2007).

However, the research efforts on these devices date back to the studies on the legal foundation of disproportional ownership carried out by the North American Law Schools (e.g., Harvard, Yale) between the end of the nineteenth and the beginning of the twentieth century (Baldwin 1891; Finkelstein 1926; Harriman 1904; Smith 1922; Wormser et al. 1918). Since then the academics' interest has increased over time, but it has been characterized by a shift of its focus in 1929 when the Wall Street crash has emphasized the financial implications of the ownership structure selection (Saggese et al. 2016). Few years later, the seminal work of Berle and Means (1932) on the separation between ownership and control in the US has further boosted the research on CEMs. Nevertheless, from the mid-1930s onward, the adoption of fiscal restrictive regulations (e.g., regulation on intercompany dividends in 1935) has fostered the disappearance of certain types of disproportional ownership mechanisms (e.g., pyramidal structures) and has braked on the studies on CEMs (Morck and Yeung 2005). As a result, for a long time, the research on control-enhancing mechanisms has been far from appearing as a body of knowledge accumulating from year to year (Saggese et al. 2016).

A new encouragement to the studies on the topic can be traced back to 1976 when Jensen and Meckling published their seminal paper on the theory of the firm. Indeed, by applying the agency framework to develop the theory of ownership structure, the above-mentioned article has represented a turning point for the research on disproportional ownership for some reasons (Saggese et al. 2016). First of all, it has contributed to the application of the agency approach as the most common lens to explain the use of CEMs. In addition, it has shifted the focus of the debate on disproportional ownership toward the European markets (Bergström and Rydqvist 1990; Nicodano 1998; Zingales 1994), where control-enhancing mechanisms are considered as proper solutions to foster company growth

by hindering the financial markets' underdevelopment (Saggese 2013, 2018).

On the basis of these premises, by relying on the conclusions of the seminal paper of Jensen and Meckling (1976), the academic discussion on CEMs has focused on the majority-minority shareholder conflict due to the separation between ownership and control (Saggese et al. 2016) and has interpreted the phenomenon through the second-type agency theory (Buzzacchi and Colombo 1996; Leech 1987). As a consequence, later studies on the topic have been mainly grounded on this specification of the agency framework to explain the owner-owner conflict that CEMs encourage (La Porta et al. 1999). In addition, prompted by the agency theory, the debate around disproportional ownership devices has moved toward the assessment of their pathological implications (Cheung and Gaa 1989; Smith and Amoako-Adu 1995). This is especially true for the entrenchment of controlling shareholders (Harris and Raviv 1988; Partch 1987) as scholars have focused on the opportunistic adoption of CEMs and on the factors that provide incentives to this phenomenon (Cheung et al. 2006; Friedman et al. 2003; Johnson et al. 2000).

In this regard, it is worth noting that the diversion from the proportionality principle due to CEMs may encourage blockholders to extract private benefits of control and expropriate the interests of minority shareholders (Saggese 2013; 2018) as these mechanisms are able to mitigate the effectiveness of the market for corporate control (Manne 1965) and the limited ownership concentration (Shleifer and Vishny 1997).

Based on these premises, the debate on control-enhancing devices has been strongly influenced by two lines of inquiry. The first one has explored the determinants of disproportional ownership, while the second one has investigated the effects of the tools under scrutiny (Adams and Ferreira 2008; Chernykh 2008; Morck et al. 2005).

As for the determinants of CEMs, the discussion has focused on the incentives to use the disproportional ownership mechanisms in order to extract private benefits of control. In particular, the scholarly debate has examined mixed outcomes of the entrenchment effect and has mainly

analyzed the tunneling practices in terms of expropriation of cash flows, assets and equity, self-dealing transactions/activities, and collusion with managers (Almeida and Wolfenzon 2006a; Bhaumik and Gregoriou 2010; Burkart et al. 1997; Cheung et al. 2006; Friedman et al. 2003). Moreover, academics have deeply investigated the factors that influence the opportunistic use of CEMs. In this regard, studies have strengthened the notion that the regulatory framework matters for the use of disproportional ownership devices (Bel and Trillas 2005; Holmen and Knopf 2004; Watanabe 2002). From the end of the 1990s, a strong contribution to this discussion has been provided by the articles authored by La Porta and colleagues on the relationship between investor protection and corporate ownership (La Porta et al. 1998, 1999) as the "law and finance" arguments have strongly fueled the debate on control-enhancing mechanisms. In line with these conclusions, the scholarly research has documented that the limited protection of minority investors arises governance and ownership issues as it provides incentives to the deviation from the proportionality principle through CEMs (Claessens et al. 2000; Cuomo et al. 2012; Faccio et al. 2010; Fan and Wong 2002; Masulis et al. 2011; Mengoli et al. 2009).

In the first decade of 2000s, the focus on the implications of investor protection for the use of CEMs has been also witnessed by the interest of practitioners and policy-makers to provide a comprehensive picture of disproportional ownership devices to foster the harmonization process of commercial and financial market regulations. This is especially true in Europe where the strong presence of CEMs has led policy-makers to assess the application of the proportionality principle in the European countries (Deminor Rating 2005; OECD Steering Group on Corporate Governance 2007). One of the most illustrative examples of this phenomenon has been provided by the attempt to map the existing deviations from the one share-one vote rule across the European listed companies by the Institutional Shareholder Services (ISS), the Shearman & Sterling LLP, and the European Corporate Governance Institute (ECGI) (Institutional Shareholder Services 2007).

The studies that have been published after the above-mentioned efforts can be divided in two groups, as they deal with corporate ownership characteristics or particular CEMs (Azofra and Santamaría 2011; Bena and Ortiz-Molina 2013; Gompers et al. 2010; Intrinsicano 2012; Langlois 2013). However, a strong contribution to the debate has been also provided by the research on the simultaneous adoption of different kinds of CEMs (Bortolotti and Faccio 2008), especially in terms of devices for leveraging voting power, to lock-in the company control (Carvalho da Silva and Subrahmanyam 2007; Gompers et al. 2010) and CEMs related to privatization processes (Borisova et al. 2012; Zhang 2014).

In addition, scholars have mainly explored the role of context and the influence of owner identity (e.g., Institutional investors, families, State, banks) on the choice of using control-enhancing mechanisms (Azofra and Santamaría 2011; Craninckx and Huyghebaert 2015; Di Carlo 2014; Kang et al. 2006; Villalonga and Amit 2006). In this regard it is worth noting that, as documented by the literature in this tradition, both factors can separately or jointly affect goals and incentives to deviate from the proportionality principle through such devices (Ben-Amar and Andre 2006; Kang et al. 2006; King and Santor 2008; Levy 2009).

Turning the attention to the studies on the effects of CEMs, academics have discussed both positive and negative implications of disproportional ownership (Almeida and Wolfenzon 2006b; Enriques and Volpin 2007; Friedman et al. 2003; Johnson et al. 2000; Jung et al. 2009; Kim et al. 2007; Morck 2005) by combining the agency and the socio-cognitive frameworks (Azofra and Santamaría 2011; Luo and Liu 2014). Indeed, scholars have been strongly committed in advancing the knowledge on the influence of disproportional ownership mechanisms on corporate governance and firm outcomes (Bennedsen and Nielsen 2010; Intrinsicano 2012; Saggese 2013). In particular, academics have examined the relationship between CEMs and company performance, drawing mixed conclusions on the role of these devices (Azofra and Santamaría 2011; Cronqvist

and Nilsson 2003; Maury and Pajuste 2005; Thomsen and Pedersen 2000).

A first strand of studies highlights that the disproportional ownership mechanisms prompt value-decreasing decisions able to limit the company performance (Bae et al. 2002; Bebchuk et al. 2000; Bianco and Casavola 1999; Chung and Chan 2012; Claessens et al. 2002; Liu and Sun 2005). In line with these conclusions, the empirical evidence documents two main effects. On the one hand, it highlights that firms ruled by CEMs are willing to make suboptimal choices to improve the blockholders' power (Johnson et al. 2000; Wei and Zhang 2008). On the other hand, it emphasizes that the financial market tends to hinder the performance of companies where disproportional ownership devices are in place due to the opacity of the related governance structures (Cheung et al. 2006; King and Santor 2008; Roosenboom and Schramade 2006; Villalonga and Amit 2009).

Opposite effects are documented by a second strand of studies suggesting that control-enhancing mechanisms improve firm results (Almeida and Wolfenzon 2006b) for a number of reasons. In particular, literature in this tradition suggests that, in given circumstances, the presence of controlling owners due to disproportional ownership is able to mitigate the agency conflicts between managers and owners (Carvalho 2012; González et al. 2012; Hanousek et al. 2007). Moreover, when the external financing is limited, the use of specific CEMs turns out to be a proper solution to address the issue under scrutiny. This is especially true for pyramidal structures as this kind of mechanisms is able to exploit the financing advantages for setting up new firms (Bena and Ortiz-Molina 2013). In addition, companies ruled by such CEMs are also characterized by internal capital markets that can effectively allocate resources among the related companies (Almeida and Wolfenzon 2006b).

Thereby, while the first strand of studies has interpreted disproportional ownership devices as tools able to expropriate the wealth of minority shareholders (Gianfrate 2007; Morck et al. 2005; Riyanto and Toolsema 2008), the second line of inquiry has emphasized their ability to support the

business and the economic growth in many countries (Becker-Ritterspach and Bruche 2012; Lin 2012; Saggese 2013).

This twofold interpretation can be explained taking into consideration that the CEMs' ability to be beneficial to firms depends on the forces and factors that shape the related use by limiting the incentives of blockholders to extract private benefits of control to the detriment of minorities.

Such circumstance is confirmed by the recent scholarly interest around the identification of proper solutions aiming to overcome the distortions of disproportional ownership (Hong 2013; Jog et al. 2010; Jung et al. 2009). Indeed, following a "law and finance approach," academics have reaffirmed the pivotal role played by the legal regulation in place to limit the conflicts and the opportunistic use of disproportional ownership (Cuomo et al. 2012; Liu and Magnan 2011; Saggese 2018).

Grounding on these premises, the ongoing debate around CEMs has shifted beyond the boundaries of the corporate governance domain and has been significantly fueled by practitioners and policy-makers involved in the harmonization process of the commercial law in Europe (Institutional Shareholder Services 2007; Lin 2017; Saggese 2018). The related policy-making interventions have tried to limit the corporate distortions due to the deviation from the proportionality principle and have spawned a new trend in the debate on CEMs in order to support the proper use of such mechanisms by promoting transparency and competitiveness of firms ruled by disproportional ownership devices (Cuomo et al. 2012; Saggese et al. 2016).

Summary

The chapter offers an overview on the characteristics and the governance issues of the ownership mechanisms that enhance the corporate control by deviating from the proportionality principle between cash flow rights and voting rights.

Controlling the Building Energy Footprint

Mika Luoranen and Samuli Honkapuro
LUT University, Lappeenranta, Finland

Introduction and Background

Carbon footprint of the utilization phase for different buildings continues to have a major role in defining the total carbon footprint for the life cycle of a building. Most part of the utilization phase carbon emissions are caused by the energy consumption, to run the building systems. The carbon footprint caused by the energy consumption of building systems can also be interpreted as the energy footprint of a building.

The following list (IEA 2018) highlights the importance and some trends of global buildings and construction sector in terms of energy demand and emissions:

- Buildings construction and operations play a dominant role in the clean energy transition, with 36% of global final energy use and nearly 40% of energy-related CO₂ emissions in 2017
- Global buildings sector energy use continues to grow, increases in population and floor area are and will be the principal factors of rising energy demand in buildings
- Buildings and construction sector emissions appear to have leveled off since 2015, a clean energy transition will enable a steady decrease in future emissions
- Global dialogue is supporting progress in developing policies for sustainable buildings.

Most countries have submitted nationally determined contributions (NDCs), many NDCs still lack specific actions

- Countries are continuing to implement and update building energy codes and certification policies. However, most expected future buildings growth will happen in countries that do not have mandatory energy codes and policies in place yet
- Investment in energy efficiency in buildings has slowed

This entry presents the principles of determining and controlling the energy footprint of a building. The Finnish energy system is used as an example, including 100% access to electricity, customer's freedom to choose electricity origin from open market, and widespread utilization of district heating. However, the principles of energy balance of a building and energy options offered by energy markets can be applied also elsewhere.

Building Energy Balance

Controlling the energy footprint of a building means in practice controlling energy consumption, peak loads, and origin of energy consumed. To be able to do this, one should be able to define the energy balance for a specific building, including the actual energy demand for space heating/cooling, ventilation/air-conditioning, domestic hot water (DHW), lighting, and electrical appliances (Fig. 1).

In Fig. 1, the building energy demand is determined by the heat losses, solar and internal gains or loads, and electricity required for operating the buildings systems and devices. The building technical systems deliver the building energy demand by utilizing different energy sources. Energy, heat, or electricity can be produced on-site, or it can be delivered from elsewhere.

Each building has a specific energy demand, depending on the structures, materials, devices,

Controlling the Building Energy Footprint, Fig. 1 System boundaries for building site energy considerations. (Adapted from Kumitski 2013)

and technical systems it contains. Also, the location, orientation, and geometry of the building have effect on the energy demand. North and south slopes of hills provide different conditions, as do flat areas compared to hillsides. Furthermore, the climate determines whether heating or cooling is dominant in producing and maintaining the indoor climate quality.

Heat Losses and Gains

In cold climates, heating of spaces determines the major part of the total energy demand, along with heating of the supply air. In Fig. 2, energy consumption in Finnish households is presented.

The coldest hours of the year determine the design of the heating system. For example, in Finland the design outside temperature for building HVAC systems varies from -26°C to -38°C , from south to north. Since the normal indoor design temperature is $+21^{\circ}\text{C}$, the temperature difference between indoor and outdoor during winter can be even up to 60°C .

Energy consumption for space heating consists mainly on heat losses through walls, windows, doors, floor, and roof structures. The properties of the components of the building envelope, together with the temperature difference between outside air and inside air, determine the gross energy demand for space heating. In annual

energy demand calculations, the heat gains are subtracted from the gross energy demand. The typical gains are solar heat gains, heat produced by humans and animals inside, and heat gains from electrical appliances. The net demand has to be covered by some means of heating, for example, central water heating system connected to a district heating grid, or producing heat by heat pump(s).

In warm climates, elsewhere in summer, solar heat and heat from humans and animals become loads, instead of gains. Cooling is needed to maintain the temperature and relative humidity of indoor air at desired level. Compared to the heating demand in cold climates, energy demand for cooling is usually lower, since the temperature difference is smaller. For example, the temperature difference is only 15°C , when the temperature outside is $+40^{\circ}\text{C}$, and inside $+25^{\circ}\text{C}$. During hot weather, the indoor temperatures are usually allowed to be a little higher compared to the heating season, to avoid any health implications due to rapid changes in temperature when people move from outside to building, or vice versa. Passive cooling methods are recommended at the first level, the rest of the cooling demand requires often consumption of electricity, since the cooling technologies are usually applications of heat pump technology.

Controlling the Building Energy Footprint,

Fig. 2 Energy consumption in Finnish households 2011–2018. (OSF 2019)

Ventilation and Air-Conditioning

Air-conditioning system involves changing of indoor air, usually by supply and exhaust fans. Achieving and maintaining good indoor climate quality requires continuous change rate of indoor air, i.e., contaminated indoor air is replaced with fresh outdoor air. Supply and exhaust fans need to be operating all the time, although the air change rate can be varied according to the utilization rate of the building.

In cold climates, a large part of the heat content of exhaust air can be utilized in preheating of the supply air, taken from outside the building to replace the extracted air. Current heat recovery units can provide the annual average heat recovery efficiency in the order of 75–80%. This means significant decrease in the building net energy demand, compared to the situation where all of the incoming supply air has to be heated with additional energy from the outside temperature to indoor temperature, for example +21 °C.

National building codes determine the required air change rates for each type of inside spaces. In Finland, the designer can choose the applicable indoor quality class, from three classes (S1, S2, and S3), and then design the outside air flows according to the quality class. The better the class, the greater the air flows. It has been studied (Allen et al. 2016; CABA 2017) that increasing the air change rate improves the efficiency of working and decreases the amount of sick leaves.

Filtration of supply air (also extract air) is important, especially in densely populated areas. Increasing the filtration efficiency means more electricity consumption, as the pressure difference over the filters increases. However, better filtration improves the quality of the indoor air.

Domestic Hot Water

Domestic hot water is needed mainly for maintaining hygiene, and cooking. Basically, the heat energy demand is more or less constant throughout the year, with some variation between the seasons – mostly from the possible changes in the occupancy rate of indoor spaces. In cold climates, hot showers are common during winter time, during the hot periods the hot water consumption might be a little lower. Also, the

occupancy rate of an office, school, kindergarten, or a residential building is likely to be less during summer vacation season than in winter.

In Finland, domestic water is usually acquired from municipal distribution system, or in rural areas, from separate wells. DHW is produced from cold water by heating it from appr. +5–10 °C to +55–65 °C. The DHW temperature should in all cases be at least +55 °C, to prevent the legionella bacteria growth inside the building water system. The upper limit in Finland is +65 °C, to avoid any burns caused by the hot water.

Appliances

In the context of defining the energy consumption for a building, all human activities are left out. In other words, only those appliances which are a part of the building systems, such as pumps and fans, are counted in. In controlling the energy footprint of a building, these appliances can generally be assumed to be controlled by the building automation system. Single appliances can be also controlled automatically individually, as long as it does not conflict with other appliances or systems.

Setting the Boundaries for Measuring the Energy Consumption

System boundaries for a building's energy consumption can be set in different ways, depending on the context. In Fig. 3, three different boundary layers for defining the net energy consumption for a building are described, in compliance with the EPBD (Directive on the energy performance of buildings) directive (EC 2018).

On-site boundary layer is normally utilized in defining the net energy consumption (total energy demand – renewable energy produced and utilized on-site) of a building. Renewable energy can be produced on building site from geo-, aero- and hydrothermal sources, to compensate the energy demand of the building. In some cases, also nearby produced renewable energy may be accepted to be included in the calculations, if the national legislation allows nearby energy production to be linked to the building. In these cases, the

Controlling the Building Energy Footprint, Fig. 3 Boundary layers of building’s energy balance. (Adapted from Kurnitski 2013)

actual production/generation capacity should be linked to the building with, e.g., long-term contracts. One solution here could be forming a renewable energy community or citizen energy community in neighborhood. Such energy communities are promoted by European directives (EC 2018, 2019). Outside of the nearby boundary layer is in practice the national electricity grid, or the local district heating grid not included to the nearby production and delivery.

Primary energy indicator is the sum of all delivered and exported energy into a single indicator, including electricity, district heat/cooling, and fuels. Primary energy factors are used in the calculation of primary energy indicator, energy consumption/demand is multiplied with the energy factor. The factors are nationally determined for different energy sources, to take account the national energy system structure, process efficiencies, distribution losses, and fuels utilized in the energy production. Fossil energy has a factor of 1, other sources are compared to this factor. Typically, electricity production has a factor >1 and district heating <1. As the national energy systems are developed to more efficient and renewable based, the factors are updated to

lower level. This will further decrease the primary energy indicator values for buildings in general.

Table 1 shows different options on how to utilize different boundary layers in order to reach the zero energy building (ZEB) status for a building.

Controlling the Building Energy Footprint Is Controlling Energy Consumption, Peak Loads, and Origin

Controlling a building’s energy footprint is in practice controlling the amount of primary energy needed to compensate the energy demand of the building. In other words, controlling energy footprint is also controlling carbon footprint of energy consumption.

Energy demand of building systems can be controlled, up to a certain point, without the residents noticing it, or feeling too much discomfort. Controlling energy demand (consumption) requires automated building systems, and in many cases information from energy markets. This means, for example, that during a period of expensive energy hours heating of floor slab can

Controlling the Building Energy Footprint, Table 1 Zero energy building (ZEB) renewable energy supply option hierarchy

Option no.	ZEB supply-side options	Examples
0	Reduction of site energy use through low-energy building technologies	Daylighting, high-efficiency HVAC equipment, natural ventilation, evaporative cooling, etc.
	On-site supply options	
1	Use of renewable energy sources available within the building's footprint	PV, solar hot water, and wind located on the building
2	Use renewable energy sources available at the site	PV, solar hot water, low-impact hydro, and wind located on-site, but not on the building
	Off-site supply options	
3	Use of renewable energy sources available off-site to generate energy on-site	Biomass, wood pellets, ethanol, or biodiesel that can be imported from off-site, or waste streams from on-site processes that can be used on-site to generate electricity and heat
4	Purchase of off-site renewable energy sources	Utility-based wind, PV, emissions credits, or other "green" purchasing options; hydroelectric is sometimes considered

Source: Torcellini et al. (2006)

be turned off for some time, and use the stored heating energy for heating. The heat storage can be charged again with less expensive energy.

Energy Origin Versus Footprint

The origin of energy consumed in the building determines the actual footprint of the consumption. The whole energy chain has to be taken into account, when the footprint is calculated. The chain includes extraction of the fuels used in production, losses in production/generation, and losses in distribution and losses in building systems.

Peak Demand Periods

Controlling the peak loads of a building can be even more of interest than controlling annual energy consumption. This is due to the structure of the heat and/or electricity production system. The higher the total energy consumption in the buildings connected to the grid, the more production units have to produce energy to the grid.

The time constant (the time during which the customer does not notice a change in service, when there is a failure in the service chain) in heating grids is normally not critical (in the order of hours), since heat is normally transported via water, and the whole grid forms a heat storage which operates as a buffer in failure situations.

In electricity grid, the balance between generation and demand has to be maintained constantly. This is done by balancing the loads in the grid and the production. Due to the nature of electricity consumption (electric loads are often on/off loads, appearing and disappearing suddenly), time constants in electricity grids are much smaller compared to heat grids, in the order of milliseconds.

The production plants can be divided in four categories:

- Base load plants (operating almost constantly, with almost constant output)
- Middle load plants (operating long periods, with reasonably high efficiency)
- Peak load plants (operating typically some days annually, using normally fossil fuels)
- Reserve load plants (in case that the local/national capacity cannot otherwise be met)

Peak demand is, by the definition, the load (basic SI unit: watt) which occurs during a period of maximum energy demand. In heating grids, this is usually the coldest time of the year, especially the coldest hours of the coldest period. During the peak load, also peak load plants are being operated, on top of the base load and intermittent load plants. Usually, the peak load plants use fossil

fuels, such as natural gas or light fuel oil, thus they have an effect of the carbon footprint of consumed heat energy.

Electricity Versus Heat

Electricity and heat consumption should be considered separately in energy balance considerations. Electricity is more versatile than district heat in building energy applications, as it can be utilized in all energy requiring processes. Also, electricity can be transported from distant production sites with fairly low transportation losses, whereas heat energy is always more or less a local product, due to its higher transportation losses. Heating of spaces involves time constants, which are in the order of tens of minutes, or hours – instead of timescale of milliseconds, which is required to maintain the balance between consumption and generation in electricity network.

Combined heat and power (CHP) production is commonly utilized in cold climates, generating heat for district heating purposes and electricity for electricity market. The advantage of CHP is the high efficiency of the generation process, up to 90%. Compared to a situation, where the same amount of heat and electricity would be generated by combustion in separate units, the overall efficiency of generation is higher with CHP. On the other hand, renewable electricity can also be generated by hydro-, wind-, or solar plants.

Demand Side Management (DSM) and Demand Response (DR) in Controlling the Energy Footprint of a Building

Demand response means the change of electricity load by final customers from their normal or current consumption patterns in response to market signals, including in response to time-variable electricity prices or incentive payments, or in response to the acceptance of the final customer's bid to sell demand reduction or increase at a price in an organized market (EC 2019).

Demand side management (DSM) is a utility action that reduces or curtails end use equipment or processes. DSM is often used in order to reduce customer load during peak demand and/or in times of supply constraint. DSM includes

programs that are focused, deep, and immediate such as the brief curtailment of energy-intensive processes used by a utility's most demanding industrial customers, and programs that are broad, shallow, and less immediate such as the promotion of energy-efficient equipment in residential and commercial sectors (EIA 2020).

DSM can take place either by user adaptation, i.e., by changing habits, or by automated DR applications utilizing IoT (Internet of Things) technologies. In this case, the user does not necessarily even notice when the DR operations are active.

Benefits of DR from the viewpoint of the controlling of the energy footprint of the building are increased self-consumption of locally generated energy, reducing the peak power, and favoring the RES in case of purchased energy (using energy in such time when RES is available from grid). Typically, all these benefits are also lowering the energy-related costs.

Service Quality Versus Energy Footprint

Energy consumption in buildings should be considered together with the quality of the service, not separately. Indoor climate is the basic service of all buildings, which involve human activities. Therefore, it is important to consider also what could be gained with improved indoor air quality, for example. For example, improving indoor air quality in offices usually means more automated control of indoor temperatures (heating/cooling), controlling CO₂ levels, increased air changes rates, etc. It can also involve better filtration of supply air, or adding natural lighting sources. Adding these features to a system will probably increase energy consumption in the building per se, but they will also increase the quality of indoor climate. Improving indoor climate quality decreases the amount of sick leaves in working environments, and increases the productivity.

Controlling the energy footprint should be also considering the quality of the service, combined to the consideration of the energy origin. In an ideal situation, with abundance of renewable energy sources, the service quality could be maximized with maximum economical and health impacts.

Factors of Energy Footprint Control

The main factors determining the energy demand for a building can be listed as follows:

- Location: Climate determines the demand for heating and cooling energy
- Building position: Utilization of natural light, solar gains/loads, valley vs. hill, etc.
- Energy-efficient building envelope: Minimized heat losses, maximized gains, minimized cold bridges, and minimized moisture risks in structures
- Indoor climate quality: Comfortability, productivity, and healthiness
- Affordable life cycle costs

In addition to the above, the most important factors in determining, and minimizing, the energy footprint for a building could be listed as follows:

- As high as possible service quality/consumed energy ratio
- As high as possible on-site/nearby RE generation
- As high as possible RER (renewable energy ratio) for acquired energy
- Utilization of DR opportunities to lower the energy costs, and to create additional value for the energy distribution/transmission structure, through peak shaving and shifting

Boundary layers are of importance, when steering mechanisms for improving energy efficiency in buildings are planned and implemented. For example, in the case if the excess on-site renewable energy generation (energy export through the boundary layer) is not rewarded, it most likely leads to a situation where solar power investments are lower. On the other hand, if the excess generation is rewarded, larger solar plants become more attractive. Furthermore, if nearby renewable energy is allowed to be calculated in the building's energy balance, it could compensate the lack of building-dedicated solar power units. In the case of abundant renewable energy

from the grid, investments on smaller renewable energy units would not be needed.

Fluctuations on energy demand, caused by different weather throughout the year and behavioral patterns of people, are the greatest challenge in achieving 100% renewable energy system. Fluctuations occur in different time scales, from daily to annual fluctuations. This means, in practice, that many energy systems operate at least part of the time with lower efficiency, compared to the nominal performance level. Shaping the demand as closer to constant, throughout the fluctuations, would benefit the energy system, as generation units could be designed smaller, and their performance would be better. Also, the demand for investments in the energy system would be lower.

In Nordic environment the outside temperatures vary greatly throughout the year, resulting a significant imbalance between annual peaks and lows. The availability of renewable energy sources, mainly hydro, wind, and solar power, is not constant throughout a year. Furthermore, the momentary demand and generation capacity of renewables are rarely equal. Hence, demand and renewable generation do not have the same pattern. This means that storages are needed, if renewable generation is expected to cover the annual peaks, usually during the coldest period. Storages could in principal be centralized, or decentralized. The main challenge in storage technologies is how to store energy with low losses and costs over seasons.

Energy footprint management of a building requires the understanding of the relevance of building structures, available building technologies, and indoor climate quality factors as parts of energy demand determination. Also, it requires understanding of regional and national energy systems and markets, and their interconnections to life cycle cost management. All the actors in the energy chain, from fuel providers to the consumer, including energy producers, distributors, and service providers, as well as legislators and decision-makers, are needed in the transformation process from the old inefficient fossil energy-based system to the future 100% renewable energy-efficient energy system.

Summary

In this chapter, the principles of determining and controlling the energy footprint of a building have been described. Determining the footprint requires recognizing the building's energy flows, in and out. Energy is required in heating and/or cooling, DHW heating, for appliances. In addition, renewable energy, heat or electricity, can also be produced and utilized on-site. This can decrease the amount of energy to be purchased from the electricity market, or local district heating supplier. This usually helps in decreasing the carbon footprint of a building, since purchased energy often is produced using at least some amount energy sources that result carbon emissions.

Benefits of demand response from the viewpoint of the controlling of the energy footprint of the building are increased self-consumption of locally generated energy, reducing the peak power, and favoring the RES in case of purchased energy (using energy in such time when RES is available from grid). Typically, all these benefits are also lowering the energy-related costs.

Energy footprint management of a building requires the understanding of the relevance of building structures, available building technologies, and indoor climate quality factors as parts of energy demand determination. Also, it requires understanding of regional and national energy systems and markets, and their interconnections to life cycle cost management.

Cooperation and Open Innovation

Maria Manuela Santos Natário, Ascensão Maria Martins Braga and Ana Cristina Marques Daniel

Synonyms

Collaboration; Interaction; Linkages; Network; Partnerships; Relationship

Definition

The notion of cooperation is associated to the relationship between firms or between firms and other actors to promote innovation and competitiveness. Cooperation is related to weak or strong ties, is the measure of embeddedness (Liu, 2013), and can be seen as the network density and linkages of different agents of innovation.

In what concerns the term open innovation, it signifies an open process in which an organization searches externally for knowledge resources to develop internal innovation. “It is the use of purposive inflows and outflows of knowledge to accelerate internal innovation, and expand the markets for external use of innovation, respectively” (Chesbrough, 2006:1). The partnerships or cooperation with external firms are important in this process (Di Benedetto, 2014) to internalize external knowledge or commercialize the knowledge internally developed (Chesbrough, 2005).

For Di Benedetto (2014), open innovation requires a strategic commitment on the part of the firm to improve its innovation performance

by complementing the internal knowledge with knowledge that exists externally.

Introduction

Cooperation and open innovation are two concepts associated with the process and dynamics of innovation. They emerge to emphasize that innovation is not an isolated process. Enterprises do not innovate by themselves; they depend on the milieu that makes them act (in the perspective of the “milieu innovateur” of Aydalot, 1980, 1985, 1986 and Camagni et al., 1999) and the performance of the several intervenients in interaction, in network and in system (from the perspective of the systems of innovation from Lundvall, 1992, 2017; Edquist, 1997 and Chaminade et al., 2018), and in the organization of the innovation process.

As refer Chaminade et al. (2018:1), “innovation is an interactive process where different kinds of knowledge are combined through communication” between different kinds of actors (users-producers of knowledge). The dynamics of innovation demand the interaction with different departments (within the company) and with the different subjects from the company’s external environment, in an open perspective and of creation of knowledge (Natário et al., 2010).

The open innovation model was developed by several authors (Bessant & Tidd, 2007; Chesbrough, 2003, 2005, 2006, 2007; Chesbrough & Appleyard, 2007; Di Benedetto, 2014; Naqshbandi & Kamel, 2017, among others) and emerges as an alternative to linear models of innovation that integrated internal research and development (R&D) efforts to develop new products or services and introduce this innovation in the market (Chesbrough, 2006; Naqshbandi & Kamel, 2017). This approach is based on building strategic innovation networks in order to promote innovation and competitiveness.

The studies of cooperation and open innovation search to understand how the firm mobilizes innovation sources internally and externally to stimulate and promote innovation and gain competitive advantages. The aim is perceiving the linkages and interactions between the actors of

innovation in innovation dynamics and which factors facilitate or not this open process.

Key Issues

In the open innovation approach, the firm mobilizes innovation sources inside and outside (Bessant & Tidd, 2007), cooperating and collaborating with external partners in the promotion of internal innovation capacity (Pavão et al., 2019).

On the territorial context, in this perspective of open innovation, the territory/region simultaneously looks at “in-out” and “out-in” scenarios (Natário, Couto, et al., 2012a) and combines internal and external ideas to create value in systems and structures territorially localized. Thus, the open innovation is understood as a structured form of behavior that can promote seeking for information from partners, while simultaneously hiding some of their regional information and requiring a strong trust between the different actors/agents of innovation (Natário, Couto, et al., 2012a).

The strong ties, the embeddedness, and network density (Liu, 2013) are vital to stimulate the cooperation and partnerships and generate flux of knowledge in order to internalize external ideas and to promote innovation and gain competitive advantage (Naqshbandi & Kamel, 2017).

To stimulate innovation and improve competitiveness, a high involvement and commitment of different actors is important. The linkages with clients and consumers as a source of information and the collaborations with public and laboratories and institutions strengthen the requirement for a more open innovation approach (Natário et al., 2012b). For Natário et al. (2012b:33), “the importance of this open innovation also appears to be associated with the networking of clients, as key elements of information in the innovation process. The experience of regions where companies have greater results shows that these connections could be stimulated through funding policies that promote the development of relationships and association with two special stakeholders: universities and clients.”

In open innovation paradigm, it is important to be part of a network and to enter “partnerships with external entities, like universities and research institutions (Perkmann & Walsh, 2007), suppliers (Emden et al., 2006) and other entities whose resources or capabilities a firm may seek” (Naqshbandi & Kamel, 2017:2).

Naqshbandi and Kamel (2017) pointed organizational culture as a facilitator or impediment of open innovation considering outbound and inbound as two types of open innovation.

The networks, partnerships, and cooperation facilitate the exploitation of knowledge and the processes of knowledge transferring and reproduce the corporate dimension, encompassing the firms, their clients, their suppliers, their competitors, and their partners (Natário et al., 2012a). The interactions between academy, government, R&D laboratories, and other institutional organizations facilitate the continuous exchange of knowledge. Both increase the ability and capacity of partners to promote innovation and gain sustainability and competitive advantages.

Future Directions

Future investigations may focus on the study of open innovation in the public sector. The growing success of open innovation practices in the administration of private companies, as explained by Chesbrough (2003), raises the question of the applicability of these principles to public sector organizations as referred by Freitas and Dacorso (2014).

Thus, a profitable field of future research would be the study of open innovation in public management.

Summary

This chapter discusses the concepts of cooperation and open innovation in a context of promoting territorial dynamics of innovation and competitiveness. In this process, interaction, linkages, networks and partnerships are highlighted.

Cooperatives

Andrea Girardi

Fondazione Marco Biagi, Università degli Studi di Modena e Reggio Emilia, Modena, Italy

Synonyms

Coops; Co-ops

Definition

A cooperative, according to the International Co-operative Alliance, is defined as “an autonomous association of persons united voluntarily to meet their common economic, social, and cultural needs and aspirations through a jointly-owned and democratically-controlled enterprise” (ICA 2015, p. 2).

Cooperatives are founded as private initiative enterprises to respond to single or multiple common needs of a group of individuals (Hansmann 1988). The special features of cooperatives are two. The first is that all members have the capacity to take place in the process of decision-making and governance (International Co-operative Alliance 2015; Matten and Crane 2005; Stanton 1986). The second is that the members of a cooperative are either the consumers or the workers and not capital investors (ICA 2015; Zeuli and Cropp 2004). The interests of the cooperative, therefore, coincide with those of the users.

There are different types of cooperative: consumer, retail, housing, worker, banking, insurance, agriculture, and utility cooperatives (Zeuli and Cropp 2004).

Cooperatives are based on seven principles: voluntary and open membership; democratic member control; economic participation by members; autonomy and independence; education, training, and information; cooperation among cooperatives; and concern for community.

Cooperatives usually have tax special rules that exonerate members from income tax, up to a point

(Caves and Petersen 1986), and receive support from governments.

Finally, cooperatives may present some problems in raising capitals and for free-riding actions (Mazzarol et al. 2011).

Origins and History of Cooperatives

Cooperatives are organizations whose origin is extremely remote. It is believed that already at the early days of prehistoric human societies, there were forms of organized associationism in the form of cooperatives whose task was to distribute resources and tasks among the members of the tribes so as to preserve the survival of the entire community (International Co-operative Alliance 2015) over time. The ancient origins of cooperative forms were designed to serve the needs of members, even if difficult to date back to their origins indicate the importance of cooperative action in human societies.

The earliest documents showing the existence of associations in the form of cooperatives dated back to 1498 with the creation, in Aberdeen, of “The Shore Porters Society” which operated in Scotland as a workers’ cooperative in the logistics and goods storage sector (Mazzarol et al. 2011). Subsequently, other examples can be found in France and England in the eighteenth century (Mazzarol et al. 2011; Williams 2007).

But it was only in the nineteenth century that, following the industrialization of the economy of modern societies, the cooperation movement developed.

Robert Owen, who lived from 1771 to 1858 in Scotland, is considered the father of the cooperative movement. He was convinced that the workers of his well-performing cotton trade company could have better worked if they had had the opportunity to participate actively in the governance of the company and if they could have received benefits such as education for their children etc. (Owen 1967).

In 1844, 28 artists of the Rochdale Society of Equitable Pioneers established the “Modern Cooperative Movement” in Lancashire (International Co-operative Alliance 2015). The aim was

to provide fresh food, such as oatmeal, flour, sugar, and butter, to the community in a way that the surplus was redistributed among the members of the cooperative and no disparities emerged.

The most important international body of the cooperative movement was founded later in 1891. The “International Co-operative Alliance” in London came into being. It shapes and preserves the cooperative principles and supports cooperatives in many countries around the world (International Co-operative Alliance 2015).

Today, many sectors experience companies organized in the form of cooperatives. Among the 300 largest cooperatives, 117 operate as insurance companies, 95 are in agriculture, 53 are cooperative supermarket, 21 are banks, and the others operate in 5 other sectors (World Cooperative Monitor 2019). It is estimated that cooperatives employ over 100 million workers and support the daily life needs of 3 billion people around the world. Internationally, the 300 world largest cooperatives have a turnover of between \$600 million and \$65 billion (Cronan 2007), and, altogether, they generate a total turnover of \$2,034 billion (World Cooperative Monitor 2019).

They operate in many sectors such as agriculture, banking, insurance, supermarkets, etc. (Mazzarol et al. 2011).

Description of Cooperative

Cooperatives are created as organizations aimed at satisfying common needs of a group of individuals. The group of individuals who give rise to and participate in the cooperative is individuals who can be very heterogeneous in economic/social extraction but share a need that cannot be addressed individually (Diaz-Foncea and Marcuello 2013). People do not found a cooperative either with the aim of maximizing profit or for regulatory compliance. Instead, the aim is to help each other in a particular task or service (Simmons and Birchall 2004). Hence the two main types of cooperative are consumers’ and workers’ cooperatives.

In the first type (consumers’ cooperative), the business is owned by the cooperative’s

consumers, and they elect the board of directors from among themselves. In the second type (workers' cooperatives), the society is created and governed by its employees. The interests of the society are the same as the interests of its workers as who actively operates in the company also owns it (Stanton 1986).

Types of Cooperatives

The social purpose of consumer cooperatives depends on the type of service/product they provide to their members. Retail cooperatives, housing cooperatives, utility cooperatives, cooperatives banks, and social cooperatives currently operate on the market (Zeuli and Cropp 2004).

Retail cooperatives represent supermarkets or grocery stores that are owned by its customers whose reason for membership is the need to obtain goods whose price is cheaper as a consequence of collective rather than individual negotiation. Retail cooperatives are very common in many countries. In Denmark, Singapore, Italy, Finland, and Switzerland, for example, the largest market share in the grocery store sector is captured by costumer-owned cooperatives.

Housing cooperatives represent real estates owned by the people who reside in them. Members usually take place in the process of construction and maintenance of cooperative buildings. Providing high value/cost ratio housing and good neighborhood relations are the main objectives of a housing cooperative. In order to do so, housing cooperatives pool together the members' resources and gather more negotiating power toward the propriety vendors. Furthermore, the members are entitled to elect their representatives who have the power to screen the new residents' settlement requests in order to only select the most trustworthy families.

A utility cooperative delivers a public utility (water, electricity, and telecommunications) to its members. They were born in order to build the necessary infrastructure to bring the services to those rural and hardly reachable areas. The original members of this type of cooperative joined together to get access to modern utility services

and, by doing so, let their local community enjoy a service which was otherwise unattainable for individual families. Electrical cooperatives are not rare in the USA, and a telephone cooperative still operates as phone and Internet provider in the UK.

Cooperative banks play a crucial role within the financial and economic world system (Freeman and Lomi 1994). They operate in many countries around the world, and, in Europe, they represent the 20% of the banking sector market share (in 2019). They can be in the form of retail or commercial bank. The main aim of a cooperative bank is to provide deposit and loan services to its members. In fact, they have nonmember clients, and they can be traded on public stock markets even if they still are ruled by members.

The last consumers' cooperative type is represented by social cooperatives. They carry a mixed social and capitalistic mission. They play a pivotal role in many social sectors such as healthcare, education, sustaining of people with disabilities, immigration, equality, addiction care, and many others. In order to operate, they also need to manage financing and budgeting; however, these activities shall be functional to the performance of social actions.

The second type of cooperative mentioned above is called worker cooperative. In a pure worker cooperative, only internal workers can be members (Kremer 1997). The society cannot have employees but only members as part of the workforce. The cooperative is set and governed by those who actively provide their work inside the organization. In recent times, however, a more hybrid structure of worker cooperatives has taken place. Consumers, community members, and investors can hold a worker cooperative's share. However, the majority of its shares are required to belong to the workers.

Principles of Cooperatives

Cooperatives, as stated by the International Co-operative Alliance (ICA), are founded on seven principles that have evolved over time (Dunn 1988; International Co-operative Alliance 2015):

1. Voluntary and open membership. Participation in the cooperative is free and autonomous. Cooperatives are open to all people who are able to use their services and who are willing to accept the responsibility that being a member brings with it. Nobody can be forced to take part in a cooperative and, likewise, no one can be excluded. This principle is meant to avoid the possibility to discriminate potential members for their gender, race, and political or religious preferences.
2. Democratic member control. Members of a cooperative democratically control the society and actively participate in the process of decision-making. In primary cooperatives, the voting rights are equally distributed among members (one member, one vote). Also, cooperatives at other levels are governed in a democratic manner (Varman and Chakrabarti 2004).
3. Member economic participation. Members of the cooperative contribute equally to the capital of their cooperatives. Consequently, the capital of cooperatives represents, even if only partially in some cases, the common propriety of the cooperative. Profits of the cooperative are allocated following these purposes: benefiting its members accordingly to the frequency of interactions they have with the cooperative; reinforcing the cooperative's capital structure by allocating to reserves (many of which are not available); and sponsoring other community activities approved by the membership.
4. Autonomy and independence. This principle states that cooperatives are self-help, autonomous organizations in which their members have the control. Whether cooperatives are to join agreements with other organizations or intend to raise capital from external sources, they should always do that in terms that ensure the autonomy of the cooperative and its democratic control by their members.
5. Education, training, and information. The development of the cooperative depends also on its ability to educate and train its members, employees, representatives, managers, etc. In addition, they are in charge of informing

general public, and specific new generations, about the nature and advantages of cooperation.

6. Cooperation among cooperatives. Cooperatives should cooperate among them in order to better serve their members' interests and to consolidate the cooperative movement's value.
7. Concern for community. Cooperatives, putting into practice policies approved by their members, work for the sustainable development of the communities they belong to.

These ICA (International Co-operative Alliance 2015) seven principles are fully comprehensive of the values of a cooperative business. However, in order to be commonly accepted as a cooperative, the basic three principles (proportional distribution of benefits, user-ownership, and user-control) should be satisfied. According to scholars and cooperative leaders, the other principles are to be considered as useful recommendations as they are not applicable to all regions and to all sectors. For example, cooperative banks discriminate new members on financial criteria; otherwise the cooperative could face significant financial stability risks. Housing cooperatives cannot admit everyone as they have limited physical room for new memberships.

Fiscal Advantages of Cooperatives

An important advantage of cooperative businesses is related with fiscal treatment (Caves and Petersen 1986). Corporate tax rules are different in every country of the world. However, cooperatives are generally believed to produce social welfare and, for this reason, many countries have special fiscal rules for cooperatives' surpluses in order to incentivize the development and strengthening of their social positive impact. Indeed, in many countries, members are only taxed based on the income they receive from the cooperative. The share of cooperatives' profits not distributed does not generally contribute to the determination of corporate tax base. As a result, cooperatives are not stimulated to distribute profits and, on the other hand, are

incentivized to invest in new corporate assets (Hansmann 1988).

Differently, cooperatives that mainly operate for profit are taxed just like ordinary businesses. However, they are still able to benefit some indirect fiscal advantages. They can reduce their amount of taxation by paying their members with refunds and discounts on products and services. Every action of the cooperative toward members' need satisfaction is usually well regarded by state governments.

Cooperatives usually receive financial support from governments and private foundations as they act as a social welfare increaser.

Main Disadvantages of Cooperatives

Even if cooperatives seem to provide positive effects on management, resources allocation, democratic participation, taxation, etc., some problems of this organizational form have been recently investigated. In particular, the main problem concerns the risk of free riding, the difficulty of raising capitals on the secondary financial market, and the management of the portfolio (Mazzarol et al. 2011).

Cooperatives are clearly exposed to the problem of free riding. Some members may be tempted to join the cooperative only for particular interests without proving other members with any service or help. For this reason, some new cooperatives introduce a closed membership.

Raising capitals for a cooperative may be more complex than for ordinary businesses as they cannot address the capital market easily.

The management of the portfolio in a cooperative may result slightly more difficult than in an normal company as investment decision is tied to patronage and members often pressure the board to reduce risk.

The Diffusion of Cooperatives in the World

The cooperative model is widespread around the world, and many countries have account for

companies that operate as cooperatives. However, there are regions in which the presence of cooperative companies is more embedded within the cultural and historical settings of the society. Europe accounts for hundreds of thousands of cooperative companies and represents the continent with the most relevant presence of this type of organization also due to the tradition in European countries. In Italy, England, Germany, France, and Spain, a relevant part of the economy is represented by cooperatives (Quintana and Cooperatives Europe's Team 2016).

Following European tradition, even Americas see many companies operating as cooperatives specially in the agriculture sector.

A more contained number of cooperatives are currently operating in Asia (with exception for India), Africa, and Australia.

Insights for Future Research

Research on cooperatives should focus on the results of the implementation of this organizational model in different geographical and cultural contexts (Harris et al. 1996).

It is important to study how the different national regulatory frameworks encourage or disadvantage the creation and the maintenance of this type of entity (Holmström 1999).

Differences in the performance of cooperatives should be investigated according to whether they are cooperatives whose members are customers or workers.

In addition, possible methods of measuring the performance of cooperatives and possible management structures that can create value for cooperative members in the long term should be investigated (Mook et al. 2007).

Summary

Cooperatives are special forms of organization in which the members can be customers or workers who not only own the cooperative but participate in its governance actively and democratically.

The origins of cooperatives are ancient, and it is believed that some prehistoric organizations, aimed at the management of resources and tasks, already had a cooperative form in the tribes. Only in industrial times, however, did they become structurally and formally part of the economic and social context. In 1844 the cooperative “Modern Cooperative Movement” was founded, starting a further cooperative tradition. Today, many players in various sectors such as agriculture, insurance, grocery, etc. are organized as cooperatives developing a considerable economic and employment turnover.

The members of the cooperatives can be, alternatively, customers or workers of the organization, and there are some different types of cooperatives. The most important are retail cooperatives, housing cooperatives, utility cooperatives, cooperative banks, and social cooperatives.

Cooperatives, although they develop in very different forms, are guided by seven fundamental principles that govern their constitution and

governance. These principles are voluntary and open membership; democratic member control; economic participation by members; autonomy and independence; education, training, and information; cooperation among cooperatives; and concern for community.

In addition to historical and ethical aspects, cooperatives are also established for fiscal advantage reasons. Usually governments grant tax advantages for the profits that cooperatives reinvest in their activities or that they allocate to social activities.

The cooperative model also has disadvantages. Cooperatives may be more subject to the problem of free riding, and it is more difficult for them to access the capital market and the management of the portfolio.

Although much has been published about cooperatives, future research should focus on issues related to the diffusion of the model in different regions of the world and on effective measurement systems that can capture both the

Co-ownership/Collective Ownership

Caterina Pesci

Collective property; Common pool resources

Definition

A collective ownership is an organization in which people cooperate for managing the collectively owned assets. This organization benefits all the members composing the group of owners. The group owners can vary in terms of dimension and can range from few people to a large group depending on the assets collectively managed.

Collective ownership has been described from a legal point of view as “another way of owing” (Grossi 1977). This ownership does not neglect private ownership and is not opposed to it, but it coexists together with private property for achieving collective results aimed to the common good of society (Pesci et al. 2020).

In western countries, this form of organization in the past centuries has been used for satisfying needs that people alone could not satisfy. Collective ownership resulted more efficient than private property in managing particular types of resources in a cooperative way in substitution or behalf of the local or national authorities.

This cooperative form of management of properties collectively owned helped for centuries and still helps in guaranteeing a proper exploitation of impervious lands (Dodgshon 2019). The common management of the lands object of care by collective property is helpful for developing civic sense. Each member of the organization, indeed, participates to preserve and to take care of the collective owned assets.

The majority of these organizations do not benefit members in monetary terms by sharing profits, but they provide the members with rights of use and exploitation of the managed assets.

Collective Ownership Studies

Collective Ownership gained attention of scholars because it has been considered able of avoiding the tragedy of commons described by Hardin (1968) due to the overexploitation of scarce natural resources. Commons, as defined in Hardin’s (1968) work, are subject to overexploitation when privately managed or when their use is not ruled, because they are goods not excludable and rival; consequently each user rushes “to harvest the resource before the next person does” (Hardin 1968, p. 1244). The resulting exploitation compromises the possibility of survival in the long run of our planet and causes direct and indirect negative consequences deserving particular attention (i.e., climate change).

The model of collective property has been deeply investigated by Ostrom (1990) who concentrated the attention on Alpine Swiss villages and the collective management of the Alpine impervious lands that this ancient organizational form made over centuries. Alpine collective ownership/property, indeed, was born centuries ago to assist local inhabitants in their old agroforestry activities that in the past could be performed only during the short summer season before the arrival of the hard wintertime (Netting 1981). The collective management of pastures and wood, therefore, could give to the indigenous population the possibility of obtain numerous advantages.

Even if, thanks to the studies of the Nobel Prize Hellinor Ostrom (1990, 2000, 2002), Alpine collective ownership has been deeply investigated, other forms of collective ownerships/properties exist and they are spread in different locations and countries, but they are similarly managed in a cooperative way for benefitting all the members of the local communities.

For example, Wade (1988) studied collective ownership in commonly managed irrigation systems in South India. In the same line, Mosse (1997) through an historical and ethnographic exploration of indigenous tank irrigation systems in India challenged the economic-institutional modeling of common property systems in terms of sets of rules and cooperative equilibrium outcomes. While Adhikari et al. (2004) studied collective ownership in Nepal, examining the relationship between household characteristics and common property resources used, in order to assess whether poorer households are able to gain greater access to community forests. In addition, the concept of collective ownership has been investigated in relation to its potentialities in urban contexts by examining three case study regions in Sweden, Germany, and South Africa and elaborating on their role for biodiversity conservation in urban settings (Colding et al. 2013).

The abovementioned studies demonstrated how the model of collective ownership has developed in different countries where the need of managing the environment was felt as an urgency and where the union of people for achieving natural resources' management goals has been considered essential.

In some areas, in recent times the institution of collective ownership has been further developed, gaining attention and becoming object of normative care with the growth of specific regulations (Baur and Binder 2013).

From a regulative point of view, the case of Alpine collective ownership in Northern Italy is particularly worth of attention because the collective ownerships of the Veneto Region of Cadore's valley pushed for being legally recognized because they experienced a period of legal obscuration that started at the beginning of the twentieth century (Bolla 1963; Grossi 1977). After several years of legal efforts and battles, a regional law in 1996 and a national law in 2017 arrived to recognize the centenary rights of these organizations over the managed lands. In addition, these laws recognize to the collective ownerships an important role connected to sustainability issues.

Accordingly, currently Alpine collective ownership/property is mainly becoming an organization for protecting the local environment and to guarantee a sustainable use of Alpine lands. The deep changes in the local economy mainly based on tourism, indeed, are required for these organizations to reshape their core activities toward the new needs of the local society to which members belong. These needs are obviously related to environmental and sustainability issues that must be addressed. In the ability of reshaped collective properties of meeting new social needs and of addressing new issues dwell their resilience during past centuries and their future perspectives as well (Ostrom et al. 1999).

In general, this organizational model of management and governance has been important for the development of several lands where geographical morphology and social conditions were particularly difficult. This model still represents an effective way of governing commons and it is worth of serious investigation from several angles.

Collective Ownership an Interdisciplinary Field for Investigating Sustainability

The studies on collective ownership can provide with an idea of the interdisciplinary of this field, because they encompass several disciplines: law, economics, ecology, geography, management, accounting, anthropology, sociology, and history.

An important area of development of current studies is connected with sustainable issues and the contribution of these organizations to sustainable use of lands (Agrawal and Benson 2011). An interdisciplinary view for studying this subject should be adopted. The implications of efforts direct to investigate challenges and impacts of collective property's model can result of particular interest for people involved in their management and for achieving sustainable development goals. In this regard, the work of Agrawal (2001) pointed

the attention on the sustainable governance of resources allowed by collective ownership model.

Another area of research that can benefit of the interdisciplinary of the subject of collective property is the arena of impact measurements that are measurement systems devoted to assess the impacts on the society and on the environment of the activity of human organizations.

Finally, this form of collective arrangements for governing commons can stimulate people to act together for protecting the scarce resources of our Planet, which is a major issue for the current and the future generations. The auspice is that a growing number of scholars continue to investigate in this arena for further exploring connected challenges and opportunities especially when connected with sustainable development.

Definition/Description

Values are ubiquitous and present at different levels of human existence. Individuals choose few core values from a large universe of values. Core values are derived from parents, teachers, friends and peers, literature and media, and our own life experiences. Core values operate at four levels of individual, group, organization, and society. Personal core values determine how individuals take decisions pertaining to life. Group/team values affect how work is done and goals achieved. The corporate core values define how an organization operates internally and externally. The societal core values make up the culture of a society and determine how members of that society think act and behave. Core values have to be developed, nurtured, and preserved at each level. A case in point is that of rise in consciousness about sustainability affecting the core values of individuals, groups, organizations, and societies.

Introduction

Value is an abstract concept that is difficult to grasp and define. Yet they are very real. They operate at an individual level and at collective levels of society, organizations, and social groups. To an individual, a set of values denotes what is important and worthwhile to adopt in life. A person may adopt a course of action or take a

particular decision in life based on what values she possesses. If that person believes in the value of honesty, she may adopt a course of action that may involve fairness toward others and making the right choices in sync with the prevailing norms of the society in which she lives.

Values for an organization mean what it stands for; it adopts in its internal functioning, and would like to propagate to others. An example of an organizational value is fairness to its employees. Such a value may guide organizational behavior to adopt a course of action that may involve not just professing to be fair but being fair to employees in all matters. If they have relationship with other organizations such as their suppliers, then they would like to propagate the value of being fair to employees to their partners too.

The types and number of values are large making up a large universe of values to choose from. But not all values are equally important to an individual or an organization. There are a finite number of values that form a set of core values that are primary and fundamental. They are the more important values to a person or an organization. Come what may, the individual may like to stick to these core values even in the face of changes. Only a life-changing experience or an encounter with a situation that might challenge the fundamental beliefs of a person does the core values change. Such encounters provide an opportunity to question and rethink the core values one possesses. It is possible that individuals might not be fully aware of which core values drive their specific actions. They might even act inconsistently with their core values sometimes that often might happen under group or peer pressure.

Values

Values are the organization's essential and enduring tenets – a small set of general guiding principles; not to be compromised for short-term financial gain or expediency (Collins and Porras 1994).

Philosophically, values are all deep-seated beliefs and attitudes that are for or against anything. A person may like or dislike, prefer or not

prefer, consider necessary or unnecessary, be open to or be averse to, treat it as right or wrong, perceive it to be beautiful or ugly, assess it to be useful or useless, and so on and so forth. All these attitudes demonstrate the values a person possesses. Not all values are equally important as some of the values might have more weight and a higher priority than others.

Individuals care about their values as these are principles, standards, traits, and characteristics that they care about. These values contribute to driving their behavior. Values held by individuals are underpinned by a set of norms or unwritten rules about what is considered to be socially acceptable behavior.

Values – though deep-seated beliefs – are different from beliefs. Values are not contextual or shaped by the circumstances. They are universal and timeless in contrast to beliefs that are contextual and are a product of the past and of the circumstances. Thus, vegetarianism may be a belief of certain social groups or religions while prevention of cruelty to animals is a value.

In Western philosophy, the term axiology denotes the philosophical study of value. It is also called the theory of value. It is the study of values and how those values are generated in a society. The term “value” was primarily seen in the economic sense of something having some worth and thus being of some value in an economic exchange. Over time, the term “value” came to include a wide variety of objects of interests beyond merely the economic sense of the term. Axiology also is related to ethics and aesthetics. All three terms deal with the worth of anything. While ethics deals with goodness, aesthetics is concerned with beauty. Studying value gives us an understanding of what is good and beautiful and why is it so.

Core Values

When individuals are in the process of selecting their values they are exercising a degree of judgment. Such an exercise involves determining *what* is important as well as *how* important that is to

them. Individuals determine a set of values as being relatively more important to them. Having determined such a set of values as being relatively more important, they assign inter se importance to the values in such a set. This process of exercising judgment leads to the identification of core values. Once an individual has decided on a set of core values, it becomes the means for them to decipher the world around them, take action, exhibit behavior, justify their actions, and judge others' actions. The core values are the fundamental values that guide conduct of an individual or an organization. They help in determining right and wrong.

Where Do Core Values Come From?

Values, particularly, core values of personal nature come from several sources that we experience over our life time. Several of these are from nature that is the environment in which we grow up as children. Thus, parents, other family members, and adults in the society around, our friends and peers, from the literature we read and the media we watch and listen to, and our own life experiences as we go around the world interacting with people.

Our parents pass on their genes to us and we inherit our sense of personal core values from them. Apart from the genes, parents are also our first teachers. We learn so much from them that go into us and remain as core values. A child brought up in a family of hardworking and honest parents grows up with a sense of diligence and honesty. Another child brought up in an atmosphere where parents might be alcoholic and abusive may grow with a set of negative core values that might include the belief that the world is a nasty place.

Our other family members and other adults with whom we come in contact during our childhood and adolescence impact us in many subtle ways and shape our core values. Many of us have a favorite uncle or a resourceful aunt with whom we identify. We are also influenced by our teachers at school. In fact, some of the teachers have a lifelong impact on us by their behavior and

conduct. These shape our personal core values as we go along.

Another influential source from whom we derive core values is our friends and peers. Beyond our family, we associate with friends at school and college and peers work. We derive a lot of sense about core values from our friends especially those who seem to have leadership qualities and whom others like to emulate. The famous quote of Aesop, “a man is known by the company he keeps” is so true. We like to be surrounded by people who are like us or we tend to associate with people whom we like. We tend to develop positive or negative core values depending on the type of friends and peers we have.

Religion plays a vital role in the life of most people around the world. It is a potential source of moral values that individuals imbibe through a process of acculturation in a society. One of the roles of the parents and elders is to impart moral values that are most often done through the learning of religion. Individuals adopt and follow the norms of religion that are moral values such as considering all human beings as worthy of respect and dignity, speaking the truth and acting with honesty in interpersonal dealing.

A source that has a deep impact on us as we go along in our lives is the literature we read and the media we watch and listen to. The value of good literature lies in its ability to impart good, positive values to us. Reading literature and reflecting on it shapes our thinking and sense about core values to a large extent. This might happen imperceptibly and we might not even be aware of how and why this is happening. Similarly, the type of movies we watch and the type of music we listen to also impacts our choice of core values.

Significant life experiences both pleasant as well as unpleasant affect our lives and thinking. These go on to shape our beliefs and attitudes to things. Many of us develop positive core values in response to the pleasant experiences we have had in our childhood and adolescence. On the other hand, some of us also face unpleasant situations that are deeply disturbing and even traumatic and that end up shaping our beliefs about the world at large.

Types/Levels of Core Values

Core values operate at several levels as shown in Fig. 1. There are four levels shown that are personal, groups or teams, organization, and society. Core values of an individual are the personal core values. The group or team operates on the basis of the team core values. Core values of an organization are its corporate core values. Finally, the society exhibits the societal core values. The arrows show the direction in which core values intermingle with the other core values at other levels. The core values move both ways across different levels. This creates a system of core values where, for instance, the societal core values impact the core values at corporate, team, and personal levels. Similarly, there is some impact of personal core values on the team value and subsequently on the corporate and societal core values. In such a situation, there is a blurring of lines between the different levels of core values.

Personal Core Values

Personal core values are “personal” to every individual human being. They are emotionally charged one-word statements that consume our hearts and minds and help to define what our real self is. The most important core values are the ones that are different for each individual

Core Values, Fig. 1 Different levels at which core values operate

person. The set of core values might never be duplicated. There are several core values that are common. One such is belief in God that believers share among them. Another common core value is the importance people give to work in their lives. This might be seen in the value statement such as: "working hard is essential to success in life." As can be seen, people may differ in their core values. Some may believe that hard work alone is not essential to success in life. Rather they would need luck to be on their side or favorable circumstances that might help them more than hard work. Another good example of a personal core value is the relative importance people give to family. For some, commitment to family is of paramount importance. The family might be of secondary importance to some, their work or business taking precedence. Core values are, unfortunately, not always positive. Some people have negative personal core values such as having a negative view of the world as being selfish or brutal or every one as being untrustworthy. Some people have a negative view of life itself as being meaningless.

The Schwartz theory of basic human values identifies ten basic personal values that are recognized across cultures. These values are: self-direction, stimulation, hedonism, achievement, power, security, conformity, tradition, benevolence, and universalism. The theory also explains the sources from which these values come. Schwartz proposes that the ten basic personal values form a circular structure that depicts the motivations each value expresses. The measurement of values was done through Schwartz Value Survey and the Portrait Values Questionnaire. The findings from 82 countries support the theory. They reveal substantial differences in the value priorities of individual though the average value priorities of most societal groups exhibit a similar hierarchical order.

Group/Team Core Values

Teams perform a number of functions in organizations. Many routine and nonroutine tasks are got done through teams. Teams are also known as groups, taskforces, crew, committees, etc. They focus the attention of people on common goals to

be achieved, create the necessary cooperation and coordination among team members, establish communication link and help create better understanding, help team members to function better and feel good about working in a team, and lead to accomplishments and a sense of achievement. Teamwork is an essential part of an organization's work pattern nowadays. The result of teamwork is *esprit de corps* that is morale that becomes the basis for sharing common core values.

Team core values are those beliefs that teams have about what is right and wrong. They are about the norms and standards of behavior and conduct of team members as well as shared beliefs that all team members believe in and agree upon. The team core values help to regulate the interpersonal relationship that team members have with each other. These values also help the teams to communicate with people outside the team. The core values are relatively permanent and do not change with circumstances. The most significant purpose of having team core values is to have a unifying core that binds all the team members to the central purpose. In the absence of team core values, it is difficult to perform teamwork. Core values underpin team building that helps to keep the team members together and motivates them to pursue common goals.

A few examples of team core values are: result orientation, sense of purpose, commitment to learning and constant improvement, ability to listen and communicate loyalty and commitment, and self-respect and respect for others.

Corporate Core Values

Corporate core values are the fundamental beliefs and guiding principles that organizations decide they will adopt and follow in their internal functioning as well as dealing with the outside world. The corporate core values make up the foundation on which work is performed and members of the organization conduct themselves. There might be a large number of values but among these there are a few that are so important to the organization that whatever changes might take place around in the environment these core values remain at the core.

Examples of corporate core values could be several. Commitment to excellence, innovation, sustainability, public interest, and sustainability are a set of corporate core values that are popular among organizations. Patagonia is known for its commitment to environmental sustainability as a core corporate value. Apple is reputed as having a commitment to innovation as a core corporate value. Several public utilities and companies around the world are committed to serving the larger public interest than focusing on private profit.

The corporate core values perform many crucial functions in organizations. Among the several functions, given below is a list of the major ones.

- Act as fundamental tenets by which the organization operates
- Clarify and communicate what the organization stands for
- Guide decision-making by managers and how the business processes operate
- Lay down how systems such as rewards and penalties work in the organization
- Determine how interpersonal relation work in the organization
- Determine how inter-organizational relationships are managed

One can get a good idea about core values by learning about those things that are not core values. Values are not vision, mission, strategies, or doctrinal statements. They are also not operating practices, competencies, or cultural norms. Corporate core values do not change in response to short-term market changes in the external environment.

Societal Core Values

Societies regulate the behavior of individuals who are a part of that society and in doing so define the societal core values. Individuals have a give-and-take relationship with the society in which they live and populate. The societal core values are a common collective of the personal core values of the individuals residing in that

society. All the levels – be it personal, team, or corporate – contribute to the building up a system of societal core values. Along with societal core values, there is a system of societal norms that exists to guide the behavior of individuals. Societal norms are informal agreements by members of society to adopt certain patterns of behavior as acceptable or not acceptable and to reward or penalize behavior of individuals based on such norms. Both the societal core values and societal norms are the bases for the behavior and conduct of individuals.

Societal core values are often equated with culture in which case they are referred to as “core societal values.” Culture is generally thought of as values, beliefs, attitudes, norms, and basic assumptions shared by individuals of a group, organization, or society. Usually, culture at the level of society is associated with geographical entities such as countries or region though such an association is not very exact as societies are not homogeneous culturally. But, for the sake of ease of analysis and categorization, culture is a handy concept.

A popular explanation of societal core values is offered by the World Values Survey (WVS – www.worldvaluessurvey.org) is a Stockholm-based, global network of social scientists that survey and analyze changing values and their impact on social and political life. The survey that started in 1981 does surveys and interviews in about 100 countries and periodically reports on the findings of these surveys. The WVS seeks to demonstrate that values in a country play a major role in several aspects such as economic development, democracy, gender equality, and governance of that country.

The WVS uses data analyzed by political scientists Ronald Inglehart and Christian Welzel to create two major dimensions of cross-cultural variation in the world: traditional values versus secular-rational values; and survival values versus self-expression values. These values are explained as below.

- *Traditional values* stress on importance of religion, parent-child ties, and deference to authority and traditional family values.

- *Secular-rational values* are the reverse of traditional values and deemphasize the importance of religion, parent-child ties, and deference to authority and traditional family values.
- *Survival values* emphasize economic and physical security and encourage an ethnocentric attitude that demonstrates low level of trust and tolerance.
- *Self-expression values* focus on active participation in economic and political spheres and greater tolerance and acceptance of diversity as well giving importance to gender equality and environmental protection.

The model adopted by the WVS seeks to explain how the societal core values in different countries vary over time with changing conditions. For example, as countries improve economic conditions and improve the standard of living of their citizens they tend to move toward to secular-rational values and self-expression values. Another interesting phenomenon to note is that the value of assigning high priority to environmental protection arises as a part of the self-expression value.

Developing, Nurturing, and Preserving Core Values

Core values at the personal level are derived from many sources as described in an earlier section. Once these core values form a part of the value repertoire of an individual these have to be developed, nurtured, and preserved. In case, the values need to be reviewed in light of new facts and circumstances then new values can replace the older values that can be discarded. Often, core values undergo transformation at the time of major transitions in life. Some of these milestones are job and career changes, relationship change, habitation change, and family lifecycle transition. Thus, first job, starting a new business, getting married, having children, moving to a new city or country, and children moving out are some of the major inflection points that may result in a

reassessment of core values. It is not necessary for all core values to be changed. In many cases, it might just be an alteration of priority with an erstwhile most important core value moving down the hierarchy. A complete transformation of core values might be a rare instance.

At the level of team and organization, developing core values, nurturing them, and preserving them becomes crucial for success. The better an organization is able to internalize its core values, the better it can motivate its employees toward common goals. Organizations need to use all means possible to communicate the shared values in formal statements as well as informal means. A very common approach used by organizations is the mission statement. The media used for communicating values is the company documents, brochures, website, and social media. Orientation programs for newly recruited employees can be used to inculcate organizational values to convey what the purpose of the organization is and what it stands for. Gradually, shared values become a part of the organizational memory and internalized to the extent that they become a part of the routines and help guide decision-making.

At the societal level, the developing, nurturing, and preserving of values takes place at an imperceptible pace driven by various factors at work in the external environment. The WVS, referred to earlier, shows how societal core values undergo transformation as time passes on. As the standards of living in nations improve and the countries move from developing country stage to that of postindustrial societies the people experience relatively wider choice than mere survival. They seek some self-expression values as it happens in the industrialized western societies. With greater citizens' empowerment, the yearning for democracy heightens and people demand political choice. The aspirations for democracy rise leading to self-expression values. There is certain level of convergence between societies. They seem to follow similar trends in many sociological aspects such as family values, the institution of marriage, views about gender equality, and changing sexual orientation.

Application of Core Values

This section provides an illustration of application of core values by taking up the case of the changing attitude to sustainability over time. Sustainability is a value like freedom and democracy. A concern for environment can be a part of the personal core value set of an individual. Over the years, as more evidence comes up of the destruction of the physical environment and resources at a faster rate than they can get replaced through the self-rejuvenation process, there is a growing concern for environment. The sustainability issue has been in the limelight for quite some time. This has led to individuals as employees and consumers becoming more conscious of sustainability issues. The rising concern is also reflected at other levels of groups and organizations. There are a growing number of activists' groups that work in the area of environmental protection and sustainability. Organizations are realizing, and are made to realize, the growing role of sustainability in their internal and external operations. Governments are bringing in legislation for environmental protection and pollution control. The global multilateral organizations such as United Nations are working to highlight the sustainability through the formulation of sustainable development goals. Societies around the world are becoming more conscious of sustainability issues and incorporating values that aid in protecting and nurturing the physical environment.

Summary

Values are fairly enduring beliefs about the world in general that enable individuals to distinguish right or wrong, or acceptable or unacceptable about any phenomenon around them. Individuals choose a few core values from a large universe of values to choose from. These core values come from different sources such as genes from parents and exposure to teachers, friends and peers, the organizations where people work, and the society where they live. Values

operate at four levels of individuals, groups, organizations, and society. Personal core values are those that define an individual's choice about the world around them. Group core values determine how collectives of individuals come together for a common purpose. Corporate core values are a reflection of what the organization stands for and is dedicated to commit resources to. Societal core values express the preferences of the members of that society regarding anything. An illustration of core values is the changing attitude of people, organizations, and society about sustainability.

Synonyms

CEO activism; Corporate political activity (CPA);
Corporate social activism

Definition/Description

Corporate activism can be defined as actions taken by the firm or its executive leadership, using the power of the brand and the company's resources, in order to address a perceived social problem, to promote or counter changes to the existing social order. Corporate activism can target the general public, consumers, governments, other businesses, and other stakeholders, either as allies or as opponents in a fight for a cause. Oftentimes, corporate activism moves beyond the company's strategy, goals, and even its CSR as companies stand by their corporate values or the personal values of their leaders and against wrongs such as racism, discrimination, and destruction. However, some companies align what they fight for with what they stand for, using strategic CSR to align the company's core business and values with its activism.

Corporate Activism

Introduction

In August 2017, a white supremacist rally that occurred in Charlottesville, Virginia, was led by members of the far-right, white nationalists, neo-Nazis, KKK, and others. The marchers chanted racist and anti-Semitic slogans and carried semi-automatic rifles, swastikas, and Nazi and neo-Nazi symbols. Many stood against this rise of American racism, including companies and well-

known CEOs. Starbucks founder Howard Schultz spoke to his employees at a forum called "hate has no hope here," to "address the violence, hatred, and empowerment of white supremacists and neo-Nazis." These actions can be seen as part of a new wave of corporate activism.

Corporate activism seems to be on the rise. Gaines-Ross (2017) examined corporate responses to each of five controversial Trump administration actions and statements in 2017: the travel ban, withdrawal from the Paris Agreement on climate change, barring of transgender service members from the US military, the president's comment that "many sides" were to blame for the death of a woman at the Charlottesville riots, and the decision to end the Deferred Action for Childhood Arrivals (DACA) program. In total, 425 corporate responses were found to these actions, with seven companies speaking up in opposition to all five events: Apple, Airbnb, Box, Facebook, Intel, Microsoft, and Salesforce.

Corporate activism can be seen as a new wave in corporate social responsibility. Fully embracing their social responsibility, corporates and their leaders have started using their power to change attitudes, policies, and behaviors of their various stakeholders. While there were a few examples, such as Ben & Jerry's or The Body Shop, of companies standing by their values and political views long before the last decade, it is only recently that we have started capturing this movement, as it becomes much wider and stronger.

The academic research on corporate activism is almost nonexistent, and as of 2019, there were no academic articles on this topic. There are a few articles, mainly in Harvard Business Review, on CEO activism (e.g., Chatterji and Toffel 2016, 2018a) and many more on shareholder activism and consumer activism (Hadani et al. 2018), but not on corporate activism. While corporate activism usually takes place with the involvement of the CEO, stakeholders, and/or consumers, what we refer to here as the use of the brand and the organization to lead social change.

This entry will, therefore, offer the first definition of corporate activism, bring examples of CEO activism and stakeholder activism, and discuss the use of social marketing in service of this kind of

activism. We will also discuss the motivations and drivers behind this recent trend and the important related benefits and risks.

Corporate Activism Defined

To date, there are no existing definitions of corporate activism. To develop one, we rely on existing definitions of social activism, which Briscoe and Gupta (2016, p. 4) defined as “instances in which individuals or groups of individuals, who lack full access to institutionalized channels of influence, engage in collective action to remedy a perceived social problem, or to promote or counter changes to the existing social order.” What is similar between social activism as defined here and the examples of corporate activism we will later discuss is the motivation to remedy a social problem or change the existing social order, which is perceived as wrong by the activist. However, the major difference is that while social activism is undertaken by individuals or groups who lack power, corporations and CEOs use their immense power to drive this change.

For decades we have witnessed social activists targeting large corporations in order to change social order, from consumers boycotting Nike in 1990 to the Occupy Wall Street movement in 2011. This is referred to as “social activism targeting organizations” (Briscoe and Gupta 2016) which is the collective action routines pursued by social activists for the purpose of gaining concessions, grabbing attention, and/or mobilizing participants. To achieve their goals, social activists can choose disruptive/protest tactics (focused on creating material or reputational costs for organization) and persuasive/influence tactics (geared toward convincing decision-makers about the merits of activist claims).

Another related concept which we can build upon is corporate political activity or CPA (Hadani et al. 2018), which refers to corporate actions aimed at influencing political processes and their outcomes. CPA includes corporate lobbying, political donations, and other contributions to political action committees, grassroots lobbying, and the development of relational ties with public policy officials. However, CPA was mostly done for the benefit of a firm or consortium of

firms and possibly at the expense of the public. In contrast, corporate activism is aimed to benefit the public and society at large or at least some parts of it.

As such, corporate activism can be defined as actions taken by the firm or its executive leadership, using the power of the brand and the company’s resources, in order to address a perceived social problem, to promote or counter changes to the existing social order. Corporate activism can target the general public, consumers, governments, other businesses, and other stakeholders, either as allies or as opponents in a fight for a cause. Oftentimes, corporate activism moves beyond the company’s strategy, goals, and even its CSR as companies stand by their corporate values or the personal values of their leaders and against wrongs such as racism, discrimination, and destruction. However, some companies align what they fight for with what they stand for, using strategic CSR to align the company’s core business and values with its activism (Haski-Leventhal 2018).

CEO Activism

Bank of America’s CEO, Brian Moynihan, told *The Wall Street Journal*: “Our jobs as CEOs now include driving what we think is right. It’s not exactly political activism, but it is action on issues beyond business” (Chatterji and Toffel 2018a).

While there are currently no academic articles on corporate activism, there is recent body of work on CEO activism. Until recently, it was rare for corporate leaders to plunge aggressively into thorny social and political discussions about race, sexual orientation, gender, immigration, and the environment (Chatterji and Toffel 2015, 2018), and CEO activism, particularly as a wide trend in some societies, is quite new.

CEO activism takes place when executive leaders of large corporations use their power, their resources, and their voice to speak up on things that matter to them. One prominent example is Google former executive chairman, Eric Schmidt, who used his power and strong voice to raise awareness to climate change. In an interview to *The Washington Post* (Fung 2014), Schmidt said:

The company has a very strong view that we should make decisions in politics based on facts, what a shock. And the facts of climate change are not in question anymore. Everyone understands climate change is occurring and the people who oppose it are really hurting our children and our grandchildren and making the world a much worse place. And so, we should not be aligned with such people — they're just, they're just literally lying.

Starbucks founder, Howard Schultz, used his position to speak to his employees at the midst of the rise of American racism and the Charlottesville riots. Schultz called a large-scale meeting to “address the violence, hatred, and empowerment of white supremacists and neo-Nazis” (Dahlstrom 2017):

What we witnessed this past weekend. . . is against every sense of what is right. My fear is not only that this behavior is being given permission and license, but its conduct is being normalized to the point where people are no longer hiding their face. We've all seen pictures of the KKK in the South . . . they were hiding because they were afraid to be outed. People are no longer afraid. The moral fiber, the values, and what we as a country have stood for is literally hanging in the abyss. We are at a critical juncture in American history. That is not an exaggeration. We are at and facing a crucible in which our daily life is being challenged and being questioned about what is right and what is wrong.

There are many other examples of corporate leaders who act to enhance social and environmental goals, from Sheryl Sandberg, Facebook COO, on gender equity and women's right (captured in her *Lean In* book and movement) to Tim Cook, Apple CEO, on marriage equality and LGBT community rights.

While there is criticism against CEO activism, such as xxx, claiming that CEOs should be doing their jobs, not activism, yet, corporate leaders such as Jeff Immelt, the former CEO of GE, think otherwise:

I just think it's insincere to not stand up for those things that you believe in. We're also stewards of our companies; we're representatives of the people that work with us. And I think we're cowards if we don't take a position occasionally on those things that are really consistent with what our mission is and where our people stand.

Stakeholder Activism

While CEO activism is often seen as the cause for corporate activism, there are many other

stakeholders who can together use the company or target it to achieve similar results.

Since the 1980s with the emergence of stakeholder theory (Freeman 1994), it was understood that companies need to manage and work with a wide range of stakeholders, not just shareholders. This notion entered the corporate boardrooms all over the world. As Marc Benioff, CEO of Salesforce, recently told *Time*: “Today CEOs need to stand up not just for their shareholders, but their employees, their customers, their partners, the community, the environment, schools, everybody.”

Consequently, stakeholder activism can become corporate activism or lead to it. Stakeholders can strive to influence the organization in which they work, invest, or buy from but also target it if it acts against their values and worldview. Briscoe and Gupta (2016: 2) explained that such activists typically “target companies or other marketplace organizations whose practices encroach upon the interests of stakeholders and the larger society, deploying various tactics to gain attention and influence organizational decision-makers and the wider public.”

Stakeholder activism can be done by primary stakeholders (e.g., shareholder and employees) and secondary ones (e.g., consumers, media, and general public). Stakeholders can also be divided to internal stakeholders (e.g., employees) and external ones (e.g., consumers), consequently resulting in internal activism vs. external activism. Internal corporate activism aims to change the organization inside out, while external one aims to do so from the outside. Shareholder, consumer, and employee activism can all lead to corporate activism or at least to defense and compliance (Haski-Leventhal 2018).

Shareholder activism is the effort and attempt of shareholders to positively influence corporate behavior and demand that the companies they invest in will be more responsible and sustainable (Guay et al. 2004; Haski-Leventhal 2018). People use their rights as shareholders and their voting power to address environmental, social, and corporate governance issues. There are several ways a shareholder can make changes: vote of proxies, writing letters to the company's investor relations departments, file resolutions, and request in-

person meetings, and if all of the above does not work – they can divest their funds elsewhere (Guay et al. 2004; Haski-Leventhal 2018). Socially oriented shareholder activism is an increasingly important mechanism through which social movement organizations seek to influence the private sector by exerting pressure on corporate activities in areas such as human rights, environmental protection, and labor policies (Hadani et al. 2018).

Consumer activism is similar to shareholder activism, using consumer buying power to influence the company. The most common tactic is through consumer boycotting – a distinct class of disruptive tactics that is commonly instigated by outsider activists (Briscoe and Gupta 2016). There are many examples in which consumers boycotts led to actions by companies, such as Nike or Nestle (Zadek 2004). In a survey conducted by the Global Strategy Group (2016), consumers thought it was appropriate for companies to take a stance on most social issues, including environmental issues (nearly 80% agreed), domestic violence (74%), race relations (72%), and LGBTQ equality (52%). In another recent survey, 47% of Millennials said they believe CEOs ought to take positions on issues that are important to society, and another 51% said they were more likely to buy from companies whose CEOs express views they agree with (Walker 2018).

Employee activism is a newer concept, far less discussed compared to the other two. Unlike shareholders and consumers, employees have higher risks attached to their activism, such as losing one's job and livelihood. One well-known example is whistle blowing, when employees use their inside knowledge to inform the company's leadership or outsiders about unethical behavior. However, employee activism moves beyond this to working for companies that are engaged in corporate activism, being involved in the employer's activism, or even leading it. Gaines-Ross (2017) showed that twice as many Millennials said they would feel increased loyalty (rather than decreased loyalty) toward their own CEO, if he or she took a stand on a hotly debated issue (44% vs. 19%, respectively).

Social Marketing and Brand Activism

One way of using the company's brand to address social issues and enhance causes that are important to the company and its leaders is through social marketing. Social marketing is the use of marketing principles and tools to influence human behavior and attitudes in order to benefit society (Haski-Leventhal 2018). Kotler and Zaltman (1971, p. 5) defined social marketing as the "design, implementation and control of programs calculated to influence the acceptability of social ideas." It is a strategic or planning process, or systematic application of techniques, used for the benefit of individuals or society rather than for commercial gain (Carins and Rundle-Thiele 2014). It occurs when organizations use marketing to improve the customers' and the society's well-being.

Social marketing is not new, and governments, nonprofit organizations, and even companies have been using it for years for raising awareness and change people's behavior on various topics, such as smoking, volunteering, drinking, and driving. These marketing campaigns were not aimed at selling us something (at least most of the time) but to change our individual behavior for our own benefit and the benefit of society at large.

However, what is relatively new is using social marketing as part of corporate activism, even on controversial topics, such as marriage equality and the right of gay people to marry. In 2017, as Australians were asked to "vote" on marriage equality, Airbnb featured the "until we all belong" campaign (Airbnb 2017). Aligned with the company's slogan, "belong anywhere," the social marketing campaign called Australians to show their acceptance of marriage equality and commit to wearing a bespoke ring until same-sex marriage is recognized in Australia. Thousands of these rings were sold within 24 h on eBay at cost. The video attracted nearly half a million views on YouTube. Other companies, such as Qantas, joined Airbnb in this social marketing campaign, not without risks and negative public opinion.

This example can also be referred to as brand activism, in which businesses launch carefully designed "social good" campaigns aimed at raising awareness about a particular issue while also

promoting a positive corporate message. In 2019, Gillette aired a social campaign “We believe: The best men can be,” which was a response to the #MeToo movement against sexual harassment and abuse. While the ad attracted nearly 30 million views, it also had 1.4 million dislikes (double the number of “likes”). Other controversial examples include Patagonia’s “The President Stole Your Land” campaign to protect national parks in the USA or Nike’s adverts featuring Colin Kaepernick, the NFL quarterback who first knelt during the national anthem to highlight racial injustice.

Corporate activism can use social marketing to voice concerns and help shape people’s mindset. However, as can be seen here, it is not without risks which will also be detailed below.

Motivations and Drivers for Corporate Activism

Why do companies start to involve in social and political activism? It takes an immense amount of time, money, and other resources, using the precious time of busy CEOs and often risking the brand, and yet more and more companies are getting on board. There are several motivations and drivers which can explain the emergence of corporate activism. Gaines-Ross (2017) detailed a few: stakeholders demanding business leaders to take action in the face of distrust in the government, working according to the company’s core values, and attracting new talent, particularly Millennials.

In addition to leadership (see CEO activism above) and pressure from various stakeholders (from shareholders to consumers and employees), a sense of urgency, lack of political leadership, and a drive for a higher purpose and marketing can all drive the emergence of corporate activism.

Sense of Urgency and Public Pressure

Many of the examples of corporate activism from the last several years occurred when there was a sense of urgency that something must be said and done immediately to hit the iron while it was hot. In the face of perceived unfairness and injustice,

social wrong, and dangers, many people sense that they cannot keep silent. This was the case with the Charlottesville riots, the US travel ban, or the marriage equality survey in Australia. These were burning issues, and many, including CEOs, felt they needed to speak up, either as individuals or as the company and the brand which they lead.

There is also a sense of urgency in climate change. Although the devastating consequences of climate change may not all be immediate, there is a very narrow window of opportunity for humanity to act and mitigate this scenario. As such, many companies use their brand and what it stands for to speak up for climate change action. One such example is Ben & Jerry’s and its campaign “if it’s melted it’s ruined,” using ice cream to demonstrate what a two degrees difference can do to our planet. The company used its brand to march on many social and environmental causes, including climate change.

The sense of urgency can often bring companies, even competitors, to act together on one cause. At the time leading to the Paris Agreement on climate change, the CEOs of 14 major food companies – Mars, General Mills, Coca-Cola, Unilever, Danone Dairy North America, Hershey, Ben & Jerry’s, Kellogg, PepsiCo, Nestlé USA, New Belgium Brewing, Hain Celestial, Stonyfield Farm, and Clif Bar – cosigned an open letter calling on government leaders to create a strong accord that would “meaningfully address the reality of climate change.”

Lack of Political Leadership

Lack of strong political leadership is often mentioned as one of the drivers for corporate activism, particularly referring to the Trump administration (Chatterji and Toffel 2018a).

Political and social upheaval has provoked frustration and outrage, inspiring business leaders like Tim Cook of Apple, Howard Schultz of Starbucks, and Marc Benioff of Salesforce – among many others – to passionately advocate for a range of causes. Nearly 100 CEOs cosigned an amicus brief to encourage federal judges to overturn Trump’s “travel ban”: an executive

order banning citizens from seven Muslim-majority countries from entering the USA (Chatterji and Toffel 2018b).

A Drive for Higher Purpose

With the shift toward a purpose-driven business, led by thought leaders such as Simon Sinek (Start with Why) and John Mackey (Conscious Capitalism), many companies are searching for and communicate their higher purpose, and corporate activism can often serve these efforts.

According to conscious capitalism (Mackey and Sisodia 2014), a conscious business refers to business galvanized by higher purposes that serve and align the interest of all major stakeholders. Such a business, its leaders and stakeholders, demonstrate higher level of awareness to what is happening around them and act to create a win-win situation for all stakeholders. Having such a level of consciousness and purpose implies that the business and the business leaders cannot ignore or remain silent in face of horrendous suffering.

Whole Foods Market, for example, founded by John Mackey who co-wrote this book, is an example of a business led by high levels of consciences and purpose, striving not to turn a blind eye to suffering caused in its supply chain. Their policies and actions on animal rights and labor rights demonstrate this.

As such, some companies are motivated by “doing the right thing” and use a more deontological approach to corporate activism, rather than utilitarian and instrumental approaches.

Public Relations

Starbucks CEO, Schultz, came up with the “Race Together” initiative to hold conversation about race in the café chains. He argued that “this is not some marketing or PR exercise. This is to do one thing: use our national footprint and scale for good.”

While many companies and their leaders do not necessarily engage in corporate activism for marketing and PR reasons, there could be brand benefits for doing so.

Benefits and Risks

Corporate activism has several benefits to three main actors: the firm, the activists, and society at large. The latter, being the target of corporate activism, has the potential of benefiting the most. When companies make a stance on what they perceive as morally right and fight for a better social justice, society at large and the target group (such as Muslim travelers, the LGBT community, or other minorities) benefit from better rights. When companies work to achieve better equality, it is not only the affected discriminated against group that benefits from such actions but society at large. For example, gender equity at work benefits not only women but everyone in the company at the general community in which this company operates (Elomäki 2015).

In addition, there are potential benefits for the firm, which are similar to the potential benefits of CSR in general. Corporate activism could lead to a stronger brand and better global and local reputation, to employee engagement and performance, to higher levels of consumer loyalty, and to financial performance as well (Haski-Leventhal 2018). Employees, particularly Millennials, take a sense of pride in working for a company that is socially active (Gaines-Ross 2017).

The social activists, be it the CEO, shareholders, consumers, or employees, receive a sense of power when their voices are heard. CEO activism is becoming more socially acceptable, and oftentimes CEOs who speak up are celebrated by society and the company’s stakeholders, as could be seen with many of the aforementioned examples. When companies enable employees to be activists as part of their jobs, it gives a sense of voice to employees which also has many benefits (Duan et al. 2018). As for the CEO, corporate activism could act as a double-edged sword, depending on the company’s and the CEO’s reputation, the nature of the cause for which they campaign, the timing, and other aspects. For example, while Schultz and Chick-Fil-A’s Dan Cathy (who spoke out opposing gay marriage) have faced withering critiques for their activism, Facebook’s Sandberg and Goldman Sach’s Blankfein have generally been praised for

their public statements supporting gender and marriage equality (Chatterji and Toffel 2015).

As such, there are also many risks involved. As could be seen by the above example of Gillette, corporate activism could attract criticism from shareholders, consumers, and the general public. In a *The Wall Street Journal* article, Walker (2018) wrote:

You're a CEO, stop talking like a political activist: As a growing number of CEOs who have swept aside old taboos about activism to express their views on social and political issues, those who haven't done so are finding themselves in a perilous spot.

Consumers who do not agree with the company's worldview on LGBT rights, gun control, or immigration could stop buying from the company and badmouth it on social media. Shareholders can withdraw and take their money elsewhere. And employees may feel a low value congruence with their employers, resent, disengage, or leave.

Chatterji and Toffel (2015) argued that unfettered CEO activism has the potential to cause harm, particularly to employees if they are coerced into promoting the CEO's position. These authors further explain, however, that the power of corporate activism is somewhat constrained by the very fact that it relies on media coverage to be effective, and employees or consumers who disagree can often take their labor or purchases elsewhere.

There could also be unintended effects that were not part of activists' goals and objectives (Briscoe and Gupta 2016), such as counter activism by people who disagree with the company's perspective, stronger political actions by legislators, punishment to less powerful activists, and so on. For example, the corporate and social activism for Saudi women freedom to drive and being their own guardian may have backfired and could have resulted in the 2018 line of arrests for many female activists in Saudi Arabia.

In addition, CEO activism has sometimes led to charges of hypocrisy. For example, a few conservative websites have criticized Benioff and Cook for denouncing religious freedom laws, while Salesforce and Apple continue to do

business in countries that persecute LGBTQ individuals (Chatterji and Toffel 2018a).

In order to yield better benefits of corporate activism and avoid some of the risks, it is important for companies and CEO to be fully knowledgeable of the issues for which they stand, assure that the company's stakeholders may have freedom of expression and speech (excluding hate speech), and taking a holistic and genuine approach on these matters.

Summary

In the last decade, a new aspect of CSR has emergence in corporate activism, and academic research is yet to draw level with managerial practice. With the lack of an academic definition of corporate activism, we define it as actions taken by the firm or its executive leadership, using the power of the brand and the company's resources, in order to address a perceived social problem, to promote or counter changes to the existing social order. The current body of work on activism mainly focuses on CEO activism, which takes place when executive leaders of large corporations use their power, their resources, and their voice to speak up on things that matter to them. In addition, there is literature on stakeholder activism, particularly on shareholder activism and consumer activism, although employee activism is also on the rise. Corporate activism often uses social marketing and brand activism to achieve their goals. There are several motivations and drivers for corporate activism: in addition to leadership and stakeholder pressure, a sense of urgency, lack of political leadership, and a drive for a higher purpose and marketing can all drive the emergence of corporate activism. Finally, there are related benefits and risks that need to be considered and managed.

Corporate Citizenship

Mark Anthony Camilleri¹ and Benedict Sheehy²

¹Department of Corporate Communication, Faculty of Media and Knowledge Sciences, University of Malta, Msida, Malta

²Canberra Law School, University of Canberra, Bruce, Australian Capital Territory, Canberra, ACT, Australia

Definition

The term corporate citizenship is typically used to describe corporations in their socio-political role. It recognizes that corporations are involved in social activity beyond mere financial activities and carry obligations to contribute to the social well-being of a society. As the term "citizen" indicates, the notion is rooted in politics, indicating a recognition of the corporation as a social actor and as responding to non-market pressures. Research of the concept includes both institutional and business social scientific methods.

Introduction

Over the years, the corporate citizenship agenda has been developed interacting with distinct aspects of corporate social responsibility (CSR) (Sheehy and Farneti 2020). Its conceptual foundations can be found in the CSR literature broadly (e.g., Carroll 1979), taking cues from political science (Sheehy 2015). It includes aspects of the concepts of corporate social responsiveness (e.g., Clarkson 1995), corporate social performance (e.g., Albinger and Freeman 2000), theory of the firm (McWilliams and Siegel 2001), stakeholder engagement (Strand and Freeman 2013), and other enlightened “self-interest” theories. Corporate citizenship can be a source of opportunity, innovation and competitive advantage (Camilleri 2017a, b; Porter and Kramer 2006). For this reason, this concept continues to receive specific attention, particularly by those responsible businesses that are differentiating themselves through responsible and sustainable behaviors.

Literature Review

Multinational corporations (MNCs) have long been under pressure to exhibit “good corporate citizenship” – to participate positively to the social and political processes, to be good citizens – in nearly every country or market in which they operate their businesses. They are continuously monitored by stakeholders, including regulatory authorities, creditors, investors, customers, and the community at large. In addition, they are scrutinized by scholars and researchers.

Several empirical studies have explored the individuals’ attitudes and perceptions toward corporate citizenship. Methods in these often involve quantitative analyses of corporations’ behaviors classifying them as responsible or irresponsible when considered in comparison to what would be expected of a “responsible citizen” (Camilleri 2017a, b). Other research has focused on the managerial perceptions of corporate citizenship (e.g., Basu and Palazzo 2008). A number of studies have gauged corporate citizenship by adopting commercially available indices such as Fortune’s

reputation index (Flanagan et al. 2011; Melo and Garrido-Morgado 2012), the KLD index (Dupire and M’Zali 2018; Fombrun 1998; Griffin and Mahon 1997), or Van Riel and Fombrun’s (2007) Reptrak. Such measures rely on surveyed executives to assess the extent to which a company behaves responsibly toward the environment and the community (Fryxell and Wang 1994).

Despite the wide usage of such measures in past research, the reliability of these indices and their underlying measures and constructs remains doubtful. For instance, Fortune’s reputation index failed to account for the multidimensionality of the corporate citizenship construct and it has been questioned as to whether it is more significant as a measure of management quality than of corporate citizenship (Waddock and Graves 1997). Fortune’s previous index suffered from a flaw in that its items were not properly conceptually grounded as they did not appropriately represent the economic, legal, ethical, and discretionary dimensions of the corporate citizenship construct.

It is not that these constructs and theories are lacking. Pinkston and Carroll (1994) identified four dimensions of corporate citizenship: orientations, stakeholders, issues, and decision-making autonomy. First, they argued that by observing orientations, one may better understand the inclinations or the posturing behaviors of organizations with respect to corporate citizenship. Second, Pinkston and Carroll (1994) sought to identify the stakeholder groups that are benefiting from the businesses’ corporate citizenship practices. Third and fourth, they argued that the business’s selection of issues for corporate citizenship attention and businesses’ decision-making autonomy reflected the organizational level at which those decision-makers were located. Recognizing the problem, Griffin and Mahon (1997) combined four estimates of corporate citizenship – Fortune’s reputation index, the KLD index, the Toxic Release Inventory (TRI), and the rankings that are provided in the Directory of Corporate Philanthropy – to provide a solution.

Taking a different approach to the problem, Singh de los Salmones Sanchez et al. (2008) adopted a multidimensional perspective on three domains: commercial responsibility,

ethical responsibility, and social responsibility. The commercial responsibility domain focused on the businesses' responsibility to develop high quality products and truthful marketing communications of their products' attributes and features among customers. Concerning the second domain, they maintained that ethical responsibility is focused on businesses obligations toward shareholders, suppliers, distributors, and other agents with whom the business deal. Underlying this obligation, Singh de los Salmones Sanchez et al. (2008) argued that ethical responsibility stems from a respect for the human rights and other norms defined in the law governing business activities. They argued that contrary to Carroll, respecting ethical principles in business relationships is a greater priority than achieving superior economic performance. As to their third domain, social responsibility, they argue that corporate citizenship focuses on initiatives that are characterized by the businesses' laudable behaviors (Camilleri 2017c). The authors argue that big businesses ought to allocate part of their budget to the protection of the natural environment, philanthropy, or other socially oriented work that supports the most vulnerable groups in society. This third domain obliges the corporation to support the development of the financing of social and/or cultural activities expressing an intention improve societal well-being (Singh de los Salmones Sanchez et al. 2008).

Summary

There are several types of actors within a society. Among those actors, parties that benefit from a state, that are citizens, carry obligations vis-à-vis other members of that society. These may include the government and policy makers, businesses, marketplace stakeholders, and civil society organizations among others (Camilleri 2015). It is within this context that a corporate citizenship relationship framework can work to foster socially positive practices, which among other things would enhance the businesses' legitimacy amongst stakeholders (Camilleri 2017a, b, c,

2018). The corporate citizenship practices including socially responsible and environmentally sustainable practices may be triggered by the institutional and/or stakeholder pressures.

Corporate Code of Environmental Conduct

► CERES Principles

Corporate Codes of Conduct

Alex Almici

Department of Economics and Management,
Università degli Studi di Brescia, Brescia, Italy

Synonyms

Business code; Code of best practice; Code of ethics; Ethical guidelines; Rules of conduct

Definition

Corporate Codes of conduct consist of a codified set of ethical standards not subject to legal enforcement. They originated around in 1900 in the USA getting relevance in the 1950s due to the antitrust legislation (Wiley 1995).

OECD defines these codes as: “commitments voluntarily made by companies, associations or other entities, which put forth standards and principles for the conduct of business activities in the marketplace” (OECD 2001, p. 3).

Other relevant definitions have been formulated by scholars such as Kolk et al. (1999) who define codes of conduct as “encompassing guidelines, recommendations or rules issued by entities within society (adopting body or actor) with the intent to affect the behavior of (international) business entities (target) within society in order to enhance corporate responsibility” (Kolk et al. 1999, p. 151).

Langlois and Schlegelmilch identify the code of conduct as a “statement setting down corporate principles, ethics, rules of conduct, codes of practice or company philosophy concerning responsibility to employees, shareholders, consumers, the environment or any other aspects of society external to the company” (Langlois and Schlegelmilch 1990, p. 522).

In general, literature provides different definitions – in addition to the standard one, which is underlined at the beginning of this section – which are characterized by shared features such as: voluntary nature, self-regulatory approach, behavior

orientation, and moral guidance with respect to a specific set of issues (Alexander 1997; Forcese 1997; Diller 1999; Kaptein and Wempe 2002).

The Main Steps of Code of Conduct's Adoption

The economic development in the 1980s, the increasing integration of international markets for goods and finance, and the general privatization of state assets are some of the conditions affecting the redefinition of the economic role of the state, implying a new focus on self-regulation and on social responsibility of firms.

Indeed, the new context leads to "private governance" tools enabling the orientation of corporate behavior in a given issue area with a focus on voluntary codes of conduct defining the scope of responsible corporate practices in an industry.

In this regard, Corporate Code of Conduct is seen as a tool of behavior's orientation in the areas of labor and environment, according to principles of social equity, human rights protection, and environment safeguard.

The codes of conduct are, first of all, a specific typology of codes: "codes are an organized collection of norms used to communicate behavioral norms which are accepted or rejected within a specific institutional context. They identify which behaviors will be rewarded or punished" (Sheehy 2019, p. 3).

In particular, corporate codes of conduct originated in the USA around 1900 and developed throughout the time according to three main stages:

1. The first stage (in the late 1970s) is characterized by corporate codes focused on questionable payments (bribery) issue, considering the great amount of such practices investigated by the Securities and Exchange Commission (Kline 1985). At the beginning, the approach is actually strongly legalistic with frequent reference to antitrust laws (Wiley 1995) as such codes first emerge in response to unethical US companies' practices engaging in bribery when operating abroad. This stage mainly relates to

demands for sound management and social awareness due to a wide series of corporate scandals.

2. The second step mainly refers to the early 1990s characterized by a wide renewal of interest in corporate codes of conduct, after a decrease, by the mid-1980s, of public pressure for adopting these codes. Within this stage, codes of conduct mainly address environmental and labor issues rather than bribery as in the first step with an increasing adoption by companies. This stage underlines the shift from state regulation of transnational corporations toward corporate self-regulation in the domain of labor, environmental standards, and human rights;
3. The last stage mainly refers to the impact of transnational corporations on social and environmental conditions, focusing on globalization effects in terms of labor and human rights and on related challenges for governments. This stage refers to globalization with the related firm's understanding that social and environmental issues are becoming increasingly relevant; thus, in response to this awareness, firms introduce Codes of Conduct that are expected to ensure socially responsible behaviors. Indeed, globalization emphasizes human rights critical issues such as excessive working hours, poor wages, child labor, and hazardous working conditions, leading many global corporations to develop their own Codes of Conduct.

The Motivation and the CSR Issue

The motivation for adopting a code of conduct has been widely investigated by scholars: some argue that such codes are identified as an effective tool for solving any legitimacy problems (Howard-Grenville et al. 2008); other researchers posit that the main motivation relates to the need of introducing clear standards promoting loyalty and collaboration among the organization's members (White and Montgomery 1980) or playing a regulatory effect as a guiding tool toward ethical and acceptable conduct.

The motivation issue is closely related to the benefits arising from such codes; the most relevant are the following: reputational benefit as the adoption of a voluntary code may reflect a strategic choice to maintain or acquire a positive reputation within the institutional environment (Diller 1999); product differentiation and risk reduction, allowing firms to sell products at a higher price; improved stakeholder's relationships; investor confidence, enabling greater access to capital markets; reduced staff turnover; prevention of fraud and corruption; and enhanced employee morale.

The adoption of the Codes of Conduct depends on the level of a company's moral development; in general, the decision to formulate this specific code aims at both informing behavioral expectations and policy and reducing risk exposure.

Scholars have identified seven main reasons for adopting codes of conduct:

- Ensuring legal compliance and other statutory requirements.
- Providing a guide for behavior and formalized expectations.
- Protecting and enhancing organizational reputation.
- Ensuring employee, management, and supplier compliance and minimizing risk.
- Ensuring consistency across global networks.
- Creating and maintaining trust and confidence with stakeholders.
- Communicating principles and commitments to stakeholders (Bondy et al. 2006).

In general, corporate Codes of Conduct are drafted in order to affect the behavior of all employees in the organization. In this regard, Baker states that codes of conduct “develop incrementally, out of disparate precursor documents that were formulated for a variety of purposes as field grappled with various issues and decided, one-by-one, how best to deal with them.

By aggregating these statements of conduct into a single document that strives for a measure of universality and consistency, codifiers help a field to articulate the vision implicit in the standards that a field has already set for itself, so that this vision can be better understood and

appreciated by its membership and by the world at large” (Baker 2005).

In general, Codes of Conduct can be used according to a specific strategic approach, in order to achieve the company's selected goals; with reference to large corporations, the main motivations include the following (United Nations 2001): in some cases, codes of conduct are adopted simply to prevent external pressures; in other cases, codes of conduct's adoption aims at establishing a competitive advantage in a specific industry, by promoting the company's image and managing the reputational risks.

Besides, the adoption of ethical principles can increase the commitment of company personnel with positive effects on productivity and the overall performance. Conversely, smaller firms are usually less likely to adopt Codes of Conduct, due to the difficulty in coping with cost increases associated with any improvement of labor or environmental conditions.

The analysis of the main motivations leading to the adoption of Corporate of Conduct has implied the investigation of the relationship between this statement and Corporate Social Responsibility approach. Indeed, corporate Codes of Conduct are written statements of principle expressing the commitment to a particular conduct (Diller 1999). The introduction of corporate Code of Conduct has been characterized by an increasing emphasis on Corporate Social Responsibility (CSR) on the belief that firms should not only be concerned with profit-making; indeed, codes of conduct are also known as “codes of ethics” or “codes of business ethics” in order to depict the company's commitment to CSR.

In this regard, Bromley states that “an organization's clearest indication of a collective conscience is (...) a corporate code of conduct,” which is “designed to protect an organisation's public image, and to a lesser extent to enhance it, by declaring its moral standards to others” (Bromley 1993, pp. 196–197). In this context, corporate social responsibility is regarded as voluntary corporate commitment to face the obligations imposed on a company by society's expectations, according to a long-range plan of action.

Code of Conduct is a practical CSR tool used by firms to establish responsible business practices and to promote a socially responsible organizational culture by responding to internal and external forces, according to a global responsibility approach whose key principles are: at the social/institutional level, the principle of legitimacy; at the organizational level, the principle of public responsibility; at the individual level, the principle of managerial discretion (Kolk et al. 1999). Legitimacy is about business as social institution, framing the perspective associated to the relationship between business and society. Public responsibility concerns the single firm and its outcomes while managerial discretion considers managers as moral actors operating according to corporate social responsibility rules.

In this regard, Paine states: “by adopting its own code, a company can clarify for all parties, internal and external, the standards that govern its conduct and can thereby convey its commitment to responsible practices wherever it operates” (Paine et al. 2005).

The closed relation between codes of conduct and CSR is clear considering the CSR’s definition provided by Sheehy: “a type of international private law (that) . . . can be defined as a socio-political movement which generates private self-regulatory initiatives, incorporating public and private international law norms seeking to ameliorate and mitigate the social harms of and to promote public good by industrial organisations” (Sheehy 2015).

Similarly, Sethi states that “a corporate code of conduct is in the nature of «private law» or a «promise voluntarily made» whereby an institution makes a public commitment as to certain standards of conduct” (Sethi 2002). Indeed, in literature written on codes, there is a general belief that codes are formulated in order to encourage firms act more responsibly; Kolk et al. underline the relation between Codes of Conduct and Corporate Social Responsibility in a clear way, by defining such codes as: “encompassing guidelines, recommendations or rules issued by entities within society (adopting body or actor) with the intent to affect the behavior of (international) business entities

(target) within society in order to enhance corporate responsibility” (Kolk et al. 1999).

In this context, the role played by different stakeholders is emphasized as the CSR approach requires the wide attention for all stakeholder’s expectations; codes of conduct promote the establishment of ethical practices and behaviors enabling the safeguard of multiple dimensions (economic, social, and environmental). In other words, in order to comply with such codes’ principles and the related CSR values, firms should encourage stakeholder engagement as this approach enables firms to identify stakeholders’ expectations and promote their fulfillment.

However, the adoption of a Code of Conduct does not necessarily imply a more responsible behavior due to the so-called phenomenon “attitude behavior gap” (O’Driscoll et al. 2013). Even if such codes have been seen as a CSR tool, some scholars argue that, in many cases, firms adopt codes in order to implement *white* and *green washing* practices aiming at hiding their unethical behaviors or to avoid government legislation and intervention.

The Content and Styles

Corporate Codes of conduct have been introduced mainly in order to reduce abuse and exploitation of workers by promoting the safeguard of human rights, such as freedom and gender rights. The focus on workers’ welfare identifies corporate codes’ public aim even if these statements may address different issues such as: extortion, conflict of interest, illegal payment, and potential violations of law (Chattov 1980) or other general aspects such as honesty, equity, rights, and environmental impacts. Generally, Codes of Conduct are focused on the protection of the firm and on Corporate Social Responsibility issues, by emphasizing the acts defined by the law as punishable (for example, overcharging, bribing, and manipulating accounting books and records).

The increasing relevance of different stakeholder and related expectations (economic and noneconomic) implies a widening of the areas of responsibilities included in these codes, moving

from the initial concern for employees to the recognition of other stakeholders such as consumers, suppliers, and listed companies' shareholders.

In particular, the growing demand for firm's global responsibilities leads to the belief that codes of conduct should include also environmental contents in order to cope with different stakeholders' needs, without complicating the related adoption (Fisher et al. 2005; Singh 2006).

With reference to the content and the adopting actors, these codes have been differently categorized as follows: issue focused, such as on human rights and child labor; company codes, which are adopted unilaterally by firms; trade association codes adopted by a group of firms in a specific industry; multi-stakeholder codes resulting from negotiations among firm's stakeholders; model codes representing a benchmark for potential adopters; intergovernmental codes, negotiated at an international level and accepted by national governments (OECD 2000); industry focused, supra-organization, organizational or sub-organizational (Preuss 2010); internal codes aiming at achieving internal purposes and external in response to stakeholder pressures, which find in such codes a measure to address public concerns for corporate practices.

With reference to codes' styles, Bondy et al. (2006) identify four specific alternatives:

- Stipulative codes, using words such as "shall," "will," and including sanctions for non-compliant behaviors.
- Commitment-based codes, providing the guidelines to move toward a corporate social responsibility view as a specific company's commitment.
- Principle-based codes, including a set of principles leading companies toward the implementation of ethical practices.
- Information-based codes mainly including information about what the company has already done in terms of corporate social responsibility.

Similarly, Lowe (1996) identifies common formats including the following: the "foreign/legal" format emphasizing legal compliance and

sanctions in case of violation, typical of multinational organizations; the "follow the leader" as this approach characterizes companies that borrow existing frameworks formulated by professional associations. Other scholars make a distinction between value-based codes, mainly based on broad principles guiding behaviors; and rule-based codes, including rules and principles that must be respected (Farrell and Cobbin 1996).

The Effectiveness

In general, a Code of Conduct must ensure the following qualitative characteristics: clarity, comprehensiveness, and enforceability (Wiley 1995; Raiborn and Payne 1990).

Clarity refers to transparency and absence of ambiguity or vagueness, implying documents written in an understandable, concise, and honest way, while comprehensiveness means that the code addresses any conduct.

Finally, enforceability implies that the code provides specific description regarding expected behavior, which can violate the code and related punishments.

Enforceability is closely related to the Codes of Conduct's effectiveness; this issue has been widely investigated by scholars with specific reference to the codes' ability of improving ethical standards in organizations (Cressey and Moore 1983; Hunt et al. 1984; Matthews 1987; Kjonstad and Willmott 1995). In general, Codes of Conduct's effectiveness is generally considered weak due to the absence of monitoring activities based on sound criteria to ensure compliance (Hale and Wills 2007; Raworth and Coryndon 2004).

In this regard, Sethi argues that: "multinational codes of conduct are only as good as the public's perception and belief that companies are indeed doing what they proclaim to be doing. (...) It is ironic that while corporations expect to be audited by independent outsiders for their financial performance to ensure their investors of the accuracy of this information, they are unwilling to provide similar information in other areas of their activities including their codes of conduct" (Sethi 2002), while Robin et al. (1989) state that "codes

have little to do with ethics and may not be able to mandate an ethical business climate” (Robin et al. 1989, p. 66).

Singhapakdi and Vitell (1990) found that the enforcement of codes of conduct enables organizations to be more sensitive to ethical problems and to cope with them by choosing the best ethical alternative in the decision process.

Other researchers argue that codes have limited to no impact (Matthews 1987) and they are poor predictors of ethical values (Callan 1992); similarly, Mitchell et al. (1996) observe that no correlation can be demonstrated between the adoption of such a code and the legal/illegal behavior.

In this regard, Argandoña argues: “An ethical code may be an opportunity for a company to build moral capital and to improve ethical behavior in the company and in its community, and also to get financial or economic benefits. But the company may also use the code to attain short-term profits, exploiting a reputation for morality that does not correspond with the truth. Therefore, the existence of an ethical code is not necessarily a guarantee of moral attitudes (...)” (Argandoña 1994, pp. 151–52).

Similarly, McDonald et al. underline that codes of conduct “naturally suffer from some of the same defects (...) policies cannot cover all possible situations; they are not prioritized, and they may lead to conflicting and potentially incompatible instructions. Formal policies may also be inconsistent with day-to-day practices for getting a job done. It has been found that the more decentralized the decision-making function (and consequently the direct supervision of managers), the greater the likelihood of inadvertent noncompliance. It could also be suggested that if employees do not perceive senior managers to be complying with ethical policy, they may tend not to comply themselves” (McDonald and Zepp 1994, p. 205).

Another factor of effectiveness’ weakness has been identified in the limited integration of codes of conduct into organizational activities and regulatory system with a consequent limitation of improving ethical behaviors. Indeed, Sheehy (2019) states that: “Codes that are not integrated into a coherent regulatory system suffer from their status as a stand-alone solution, are orphaned and

destined for obscurity. Thus for codes to be effective, they must be embedded within a regulatory system that includes the necessary administrative and institutional infrastructure.”

According to some researchers, the codes’ effectiveness doesn’t work, as firms usually do not identify their core values and the related ethical priorities in the process of code development. Indeed, many firms adopt a “one size fits all approach” based on the practice of using a generic industry code, without reflecting the organization’s characteristics.

Conversely, some scholars believe that the adoption of codes of conduct produce a positive effect on employee behavior (Ferrell and Skinner 1988) while other researchers argue that the effectiveness of these code depends on the manner they are written: vague statements are less effective than detailed codes and are likely to fail to address relevant issues (Hunt et al. 1984).

In this regard, Herndon identifies specific factors affecting codes of conduct’s effectiveness such as: the code itself with reference to the writing style, applicability and enforcement measures; top management actions fighting unethical behaviors; the extent of ethical problems within the organization; the external environment in terms of industry competition and cultural approach (Herndon 1994). Similarly, Sethi argues that a code of conduct, to be effective, should be: economically viable, considering the competition forces and industry structure; aimed at addressing any relevant stakeholder’s issues, starting from employee’s ones and moving toward other affected group’s expectations; specific in order to enable the performance assessment.

In order to improve codes of conduct’s effectiveness, it should be useful to enhance corporate culture, which refers to the values, principles, expectations, and beliefs shared by the organization’s members as well as the corporate governance bodies.

In literature, corporate culture has been differently defined as: “the collective programming of the mind which distinguishes the members of one human group from another” (Hofstede 1980); “a cognitive framework consisting of attitudes, values, behavioral norms and expectations”

(Greenberg and Baron 1997); “the collective thoughts, habits, attitudes, feelings and patterns of behavior” (Clemente and Greenspan 1999); “the pattern of arrangement, material or behavior which has been adopted by a society (corporation, group or team) as the accepted way of solving problems” (Ahmed et al. 1999), and “the specific collection of values and norms that are shared by people and groups in an organizational and that control the way they interact with each other and with stakeholders outside the organization” (Hill and Jones 2001).

The improvement of values established by corporate bodies and shared with all the organization’s members can strengthen the corporate compliance to codes’ statements according to global responsibility principles. The values of a company’s corporate culture characterize its internal dimensions, orienting the behaviors of its members toward the achievement of the goals selected by the corporate governance body. Thus, it is important to establish a cultural perspective promoting the codes of conduct’s adoption and implementation, as well as ethical behaviors based on a strong awareness of social and environmental issues.

Summary

The meaning of Corporate Codes of conduct has changed throughout the time, moving from codes focused on bribery issue toward codes emphasizing the relevance of social and environmental issues. Similarly, the adoption of a code of conduct may be motivated by different reasons such as: the introduction of clear standards promoting loyalty and collaboration among the organization’s members; the need to promote ethical and acceptable behaviors. Indeed, code of conduct can be seen as a CSR tool used by firms to establish responsible business practices and to promote a socially responsible organizational culture.

In general, a Code of Conduct must fulfill specific criteria: clarity, comprehensiveness, and enforceability. Clarity refers to transparency and absence of ambiguity or vagueness, implying documents written in an understandable, concise, and honest way, while comprehensiveness means that

the code addresses any conduct. Finally, enforceability implies that the code provides specific description regarding expected behavior, which can violate the code and related punishments.

Synonyms

Community Engagement; Community Participation; Corporate Citizenship; Corporate Social Action; Social Responsibility

Definition

Corporate Community Involvement (CCI) refers to businesses' involvement in societal initiatives aimed at meeting the needs of the communities in which they conduct their operations. It differs from philanthropic activities since it allows stakeholders to enter the company's infrastructure, human resources, and business operations. CCI requires a significant commitment of both time and resources from the company towards community initiatives, distinguishing it from other types of Corporate Social Responsibility (CSR). While the latter may be motivated by the necessity to address the negative impacts of a company's operations, CCIs are unique in their altruistic intent (Yekini et al. 2015). CCIs are distinguished by their active participation in societal affairs and the engagement of companies in civic responsibilities within their local community. Furthermore, the historical roots of CCI also set it apart from other CSR initiatives.

Introduction

Corporate participation in social affairs predates contemporary notions of CSR. As Gilchrist (2003) observed, corporations were an integral part of society during the late nineteenth- and early twentieth-centuries with visible links to their communities. It was customary for businesses to make their resources available to the society in which they operated. However, in the wake of the Second World War, there was a noticeable decline in corporate involvement with society. This disconnect was exacerbated by the war's devastating impact, which left many national governments unable to single-handedly address its aftermath and reliant on corporations as partners. In summary, unlike the broad concept of CSR, CCI is a distinctive and specific form of corporate engagement with the community. It has a rich historical legacy of corporations' active involvement and interaction with their local society. Several studies (Campbell et al. 2006; Rehbein and Schuler 2015; Yekini et al. 2015) have acknowledged the distinctiveness of CCI and its dissimilarity from other forms of CSR, mainly due to its outward-looking approach and its substantial involvement with the external community. Rehbein and Schuler (2015) state that corporate community programs (CCP) are "aimed at addressing various social issues, such as poverty, education gaps, environmental deterioration, and human health" and are outward facing.

Key Issues

CCI as a Developmental Tool

As mentioned, CCI emerged as a strategic response by governments to foster economic and social renewal in the aftermath of the Second World War by encouraging businesses to engage in community development (Bush et al. 2008). This shift led corporations to transition from philanthropic activities such as donations and public relations to community development. While some community development initiatives were mandated by government policies aimed at

regeneration, some corporations today engage in such activities as part of their CSR obligations. In contrast, others do so to secure a social license to operate safely in their local communities.

Societal Expectations for It and the Demand for Its Disclosure

Over time, there has been an increase in society's expectations for corporate community involvement, leading to a demand for its disclosure in annual reports. This demand has spurred scholarly research, including works by Epstein and Freedman (1994), Cowen et al. (1987), Patten (1992), Campbell et al. (2006), Yekini and Jallow (2012), and Yekini et al. (2015, 2017, and 2021). While some scholars have focused on societal demand and motivation for the disclosure of community involvement, others have investigated the social impacts of community activities on affected groups and companies' reporting behavior over an extended period. More recently, studies have shifted their focus to the quality and transparency of the disclosures. For instance, Yekini and Jallow (2012) examined the nature of community involvement activities companies undertake and their level of commitment, while Yekini et al. (2015) investigated how the presence of non-executive directors could affect the quality of community disclosure, and Yekini et al. (2017) looked into the influence of community expectations.

The Disclosure of It by Corporations

There is a common belief that managers can improve their value maximization strategy by reporting the company's financial performance through annual reports. However, it is worth considering whether managers can fulfill their moral obligation by disclosing the company's community initiatives. Furthermore, it is crucial to examine whether the disclosure of corporate community involvement activities in annual reports can be perceived as an indicator of Corporate Community Development (CCD) or merely a demonstration of conformity to societal norms. The argument is that the language of narrative disclosures can influence thinking and affect

perception. As such, one may argue that CCID represents a communication tactic utilized by corporations to measure their achievements in corporate community involvement (CCI) or to signal observance with CSR. Nevertheless, despite identifying "the community" as a critical member of the stakeholder system, literature on CCID is scarce (Campbell et al. 2006; p. 97). In addition, a more fundamental issue with the CSR discussion, specifically the limited CCI literature, is the insufficient theorization and restricted conceptual basis that relies heavily on traditional frameworks like stakeholder and legitimacy theories, which have dominated the CSR conversation (Yekini et al. 2021). Hence, several studies (Bebbington et al. 2008; Yekini et al. 2021) have suggested novel theoretical approaches to improve the caliber of Corporate Social Responsibility (CSR) literature.

Future Directions

The advent of the COVID-19 pandemic and the invention of the new normal calls to mind the need to reinvent CCI as a developmental tool. The pandemic accelerated the advancement of technology and its use in our everyday life. Undoubtedly, CCI has a role to play on the road to recovery and the sustainability imperatives in the post-pandemic world. The challenges faced by society to restore stability and functionality to post-pandemic services without losing sight of the SDGs is a crucial direction to consider for CCI researchers and organization desiring to use CCI as a CSR tool. Furthermore, the incorporation of theoretical frameworks from other social science disciplines, including psychology, media studies, anthropology, sociology, and politics, can enhance our collective understanding of the wider CSR discourse.

Summary

To summarize, corporate community involvement demonstrates a company's commitment to social

responsibility and sustainable development by engaging in sustainable practices and strategic partnerships; companies contribute to improving communities, fostering positive relationships with stakeholders, and contributing to a more inclusive and sustainable society. To ensure accountability and transparency, companies measure and report on the impact of their community involvement efforts. Reporting became exacerbated by societal demand for it, thereby necessitating its integration into the overall corporate strategy and core business operations. Thus, companies ensure long-term commitment and sustained impact by incorporating community involvement as a strategic priority.

Corporate Compliance

Daniel T. Ostas

Michael F. Price College of Business, University of Oklahoma, Norman, OK, USA

Definition/Description

Corporate compliance refers to an organization's substantive commitment to direct the activities of its employees, management, and executive officers in ways that conform to the regulatory and ethical norms of the societies in which it operates. This commitment requires a process that aligns a firm's behavior with these norms. This process typically includes articulating a code of conduct, developing organizational rules and standards, establishing channels of communication within a hierarchy from both top to bottom (training) and bottom to top (reporting), implementing a transparent and effective system of enforcement, and empowering a top-level executive with authority to effectuate the process.

History of Compliance Programs

Before the 1980s, corporate compliance programs, if they existed, were informal. The first formal program traces to bribery scandals associated with US defense contracting during the 1980s which led to a self-regulatory body called the “Defense Industry Initiative” that continues today. Formal programs flourished with the passage of the US Sentencing Commission’s Sentencing Guidelines for Organizations [Guidelines], which identified a “corporate compliance program” as a mitigating factor when assessing a criminal fine against a corporation. The Guidelines were enacted in 1991, and within a few years virtually every Fortune 500 firm had created a compliance program.

The Guidelines specified seven factors needed to achieve a full reduction on criminal fines: (1) reasonable rules and standards; (2) high-level executive oversight; (3) diligence in hiring; (4) communication and training; (5) monitoring and testing; (6) alignment of incentives; and (7) appropriate remediation. Establishing a compliance program entailed costs; yet, if the projected savings on fines exceeded those costs, then establishing a compliance program enhanced corporate profit. Corporate counsel recommended hiring “compliance officers” to design and implement these programs. To meet the enumerated criteria, these officers were often given the title of vice president with direct reporting to the chief executive officer or the board of directors. Companies set up reporting hotlines and implemented training programs.

Compliance programs address a host of regulatory concerns including rules promulgated by the Securities and Exchange Commission, Federal Trade Commission, Environmental Protection Agency, Occupational Safety and Health Administration, and other regulatory bodies. In *United States v. Booker* (2005), the US Supreme Court held that the Guidelines were merely advisory and not binding on the courts. Nonetheless, the Department of Justice uses the Guidelines in sentencing recommendations which carry significant weight with courts. Perhaps more importantly, federal prosecutors and regulatory officials use

the Guidelines in non-prosecution agreements (NPA) and deferred prosecution agreements (DPA) negotiated during plea bargaining (Griffin 2016, p. 2087). In exchange for a reduced fine, the offending company signs an NPA or DPA stipulating that the company will strengthen its compliance program.

Today, corporate compliance has blossomed into a thriving industry complete with associations such as the Society for Corporate Compliance and Ethics that serve professionals who practice compliance across various substantive areas. New course offerings are appearing in law schools in response to the demand for compliance officers. The first compliance textbook has arrived for adoption in law schools. Compliance programs also have spread internationally. The European Business Ethics Network contributes to the growth of compliance in Europe, and the European Ethics Forum provides an annual meeting place for compliance officers. Similarly, Ben-Africa offers a forum for compliance professionals in Africa.

Economic Logic of Compliance

Corporate compliance has been folded under the umbrella of financial risk management (Miller 2017). Compliance efforts are directed to areas where legal risks are most acute. For some companies, this means concerns over price-fixing, product extensions, or other forms of anticompetitive activities. For other companies, mass tort claims provide the main threat (Coffee 2015). Most, if not all, firms must attend to issues of financial reporting and tax compliance. Of course, establishing and managing a compliance program entails costs. If economic logic prevails, then resources will be employed up to a point where the marginal cost of compliance equals the marginal benefit resulting from fewer instances of unlawful behavior (Laufer 2006).

Corporate criminal malfeasance has a long history. Edwin Sutherland (1949) coined the term “white-collar-crime” in his groundbreaking study documenting that each of the seventy largest US corporations had been found guilty of or plead

guilty to a criminal felony during the first half of the twentieth century, with an average recidivism rate of 14. Most of these crimes involved antitrust, fraud, unfair labor practices, and bribery charges. In the 1960s and early 1970s, Congress enacted a host of regulatory bodies, each with the power to levy criminal fines. The Civil Rights Act of 1964 gave birth to the Equal Employment Opportunity Commission. Ralph Nader (1965) shed light on unsafe Corvairs, and the National Highway Traffic Safety Commission was born. The Cuyahoga River caught fire, and Congress enacted the Environmental Protection Agency. Unsafe workplaces led to safety regulations. By the mid-1970s, virtually every interface between management and a corporate stakeholder was regulated, and the management of public policy became a major component of corporate governance (Preston and Post 1975). Notwithstanding the new laws, the 1980s witnessed widespread insider trading crimes of Ivan Boesky and others resulting in tighter securities laws. Later in the decade, corruption scandals associated with the Keating Five contributed to the collapse of the savings and loan industry that cost American taxpayers more than one hundred billion dollars. Continuing the trend, the new millennium brought the financial frauds of Enron, WorldCom, and Adelphia, leading to the Sarbanes-Oxley accounting reforms. The financial meltdown of 2008 gave birth to Dodd-Frank banking regulations.

Corporate compliance officers purport to scan the regulatory landscape and to take steps to protect the firm's reputation and manage financial risks. As an incentive, business scholars have identified a so-called market for morality (e.g., Dunfee 1999). Developing a favorable reputation for compliance can forestall regulatory actions, curry favor with investors, inspire employees, and attract appreciative customers. Non-compliance, by contrast, generates risks, including the risk of significant fines and dissolution, as Arthur Anderson discovered. Unfortunately, the recent Volkswagen emissions regulations scandal and the Wells Fargo fraudulent bank accounts illustrate that compliance failures persist. Too often, it seems, a business actor does a calculation,

decides that a white-collar crime pays, and fails to perceive and embrace the moral self-restraint necessary to resist temptation (Ostas 2007). So long as compliance is framed solely in economic terms, malfeasance will remain a part of the corporate landscape.

Moral Basis of Compliance

The Ethics Research Center, a part of the Ethics and Compliance Initiative, conducts the National Business Ethics Survey. Surveys show that more components (training, codes, hotlines) help, but to be most effective, workers must see these efforts as sincere, not just window dressing. In other words, it may be easy to put programs in place but difficult to inculcate an ethical culture (Langevoort 2017). To build such a culture, employees, managers, and executives must perceive corporate compliance as an ethical duty, rather than a mere economic calculation where one complies only to avoid fines. The latter approach threatens to reduce compliance to a game where it may be tempting to take advantage of underenforced laws, legal loopholes, and employ a variety of corporate legal strategies that seemingly make fraud and other crimes pay. Corporate compliance must involve more than a game where one does whatever one can get away with.

Establishing a compliance culture begins with articulating a code of conduct. These codes typically include the business ethics values of integrity, honesty, fairness, trust, and responsibility (Blodgett 2012). Ideally, the duty of legal obligation derives from and is driven by these ethical values. Most, if not all, regulations express societal standards and seek to promote moral ends. One is hard-pressed to find an example of a regulation void of moral content (Paine 1994). A reasonably just law, promulgated in a reasonably just society, deserves compliance in accord with the legislators' normative expectations (Rawls 1971, pp. 355–356; Edmundson 1999). A corporate code that emphasizes a commitment to the moral underpinning of the law is more likely to support a

compliance culture than one that portrays the rule of law as merely a set of rules. Too often, rules can be vague, gap-riddled, ambiguous, and open to interpretation. Ethical commitment, by contrast, has no loopholes (Katz 1996).

For corporate compliance to be effective, training programs must emphasize a common-sense interpretation of legal obligations illustrated with safe harbors that bring corporate actions comfortably within the law. Training programs should also emphasize the moral bases of legal obedience. These include avoiding the negative societal consequences of corporate crime and the affirmative duties of reciprocal gratitude owed to a state that provides benefits and fairness to fellow citizens who willingly obey the law. In addition, the confidentiality of the reporting process must be beyond question. Executives must hear not only good news but bad news as well. Top-level management must model exemplary behavior, displaying proper decorum, and shared sacrifice during lean times. Finally, rewards and punishments must reinforce the commitment to corporate compliance (Miller 2017).

Summary

Corporate compliance has arrived as a significant component of financial risk management and corporate governance. Programs that follow the federal Guidelines tend to reduce the likelihood of malfeasance while simultaneously reducing penalties paid for misdeeds. To be effective, the economic logic of compliance must be reinforced with an appreciation of the moral underpinnings of political obligation. Moral leadership reflected in codes of conduct, effective training, and even-handed enforcement have all proved effective in promoting corporate compliance.

Corporate Development

Lars Schweizer and Eva Maria Katharina Koscher

[Business development](#); [Development of the company](#); [Enterprise development](#)

Definition

The term *corporate development* refers to the planning and execution of strategies to meet corporate objectives (Mishra 2010). Companies may expand in new strategic markets or geographical areas, establish new business units, or engage in mergers or acquisitions to grow, or they might need to focus on core competencies or to close business units in order to succeed. While the term corporate development can be linked to an abundance of activities, activities most often falling under the term corporate development include mergers and acquisitions (M&A), investments and divestitures, as well as the incubation of new businesses (Corporate Finance Institute 2019a).

Corporate development is usually a process that takes place over an extended period of time and therefore needs to be adjusted or refined as time and projects move forward. Corporate development is strongly influenced by and linked to the environment of a company, company strategy, and company culture (Heitger and Serfass 2015).

Introduction

Corporate development involves tasks and processes to develop and implement growth opportunities for organizations. As such, corporate development strategies are closely linked to overall corporate-level strategies and try to ensure that companies engage in the right businesses and markets. Accordingly, decisions must be supported by a comprehensive understanding of where the market is today and where it is headed in the future (Heitger and Serfass 2015).

In the broader sense, corporate development can mean any activity by either a small or large organization, non-profit or for-profit enterprise, which is employed to develop the corporation in some way, but activities commonly falling under corporate development are:

1. Phasing in or out of certain products or whole markets.
2. Mergers and acquisitions.

3. Long-term partnerships.
4. Divestitures and carve-outs.
5. Strategic alliances.

(Corporate Finance Institute 2019a)

Considering the importance of these activities makes it easy to see why corporate development is crucial for any successful company.

Corporate Development Teams or Functions

Recent corporate development studies conducted by several large consulting firms have emphasized that corporate development became more and more influential over the years and that strategy and strategic planning have become critical priorities for corporate development (Ernst and Young 2015; KPMG 2015). Strategic decisions companies make today will determine their future success. Therefore, they need to be based on an in-depth analysis of the company and its external environment. But since many companies today are confronted with fast-changing markets and technologies, such an analysis requires a lot of different skills, is very time-consuming, and must not be conducted once in a while, but more or less permanently. Therefore, corporate development activities are often initiated and implemented not by the company's chief executive officer (CEO), but by corporate development teams or functions, particularly in larger companies (Ernst and Young 2015).

The responsibilities of such corporate development teams have significantly increased in recent years, with more and more involvement in strategy, business transformation, technology advancement, and cost reduction in general (KPMG 2015). The vast majority of corporate development teams now report to the CEO or the chief financial officer (CFO), which places them close to the corporate center and reflects the importance of such teams.

Internal vs. External Focus

On the one hand, corporate development is a crucial inward-looking function for a company. The goal is to identify the company's strengths and weaknesses and fill gaps in the company's geographical outreach and product portfolio

(Corporate Finance Institute 2019a). A decent internal analysis helps to understand the organization's competencies, cost positions, and competitive viability in the marketplace. Detecting new potential business opportunities is one of the main responsibilities that corporate development has to accomplish.

On the other hand, corporate development is also an essential outward-looking function for an organization as it is necessary to conduct a thorough analysis of the external environment (Corporate Finance Institute 2019a). The primary purpose of the external analysis is to determine the opportunities and threats in an industry or any segment that will influence company success. External analysis, however, also includes analyzing macroeconomic, global, political, social, demographic, and technological factors that could affect the company (Corporate Finance Institute 2019b).

To help CEOs or corporate development teams to base their decisions on a profound analysis, a number of tools can be used to perform the internal as well as the external analysis. Tools commonly used are, for example, SWOT analysis, PESTEL analysis, Porter's Five Forces Model, scenario planning, BCG matrix, and VRIO analysis.

Concluding Remarks

All corporate development activities lead to organizational change and transformation. And even though such activities are often vital for company growth or even company survival, they are also challenging to implement and manage. While corporate development projects take many forms, they share one thing in common: a dismal record of success (Heimeriks 2014). For example, "leading practitioners of radical corporate reengineering report that success rates in Fortune 1,000 companies are well below 50 percent; some say they are as low as 20 percent" (Strebel 1996, p. 86). Especially mergers and acquisitions have a meager success rate and quite often destroy rather than create value (Meckl and Röhrle 2016). What is perhaps most striking is the fact that, despite extensive experience, few organizations are able to be continually successful. Therefore, recent

research has stressed the importance of corporate development capabilities (Bingham et al. 2012; Heimeriks 2014) and especially M&A capabilities (Trichterborn et al. 2016). However, especially research in the area of corporate development capabilities is still in its infancy, and the “use of novel methodological approaches is crucial to answer emerging questions and provide relevant insights to challenges in the corporate development literature” (Heimeriks 2014, p. 5).

Since corporate development activities involve and directly affect people in an organization’s internal and external environment, it is essential to conduct such activities in a responsible way. Accordingly, the possible effects of corporate change processes have become a significant field of study, and researchers have stressed the importance of good management practices (“change management”) and communication when it comes to corporate development and change (Bowman and Singh 1993; Senior 2002). It cannot be stressed enough that without effective employee communication, change is impossible and change management fails: “Whether organizational change results from a merger, acquisition, new venture, new process improvement approach, or any number of flavors-of-the-day management fads, employee communications can mean the success or failure of any major change program” (Barrett 2002, p. 219).

Summary

Corporate development is crucial for the evolution and survival of an organization. Overall, corporate development activities can cover very different strategic options and actions. In real business life, it can be observed that large corporations apply a portfolio of different corporate development activities. Like that these corporations are able to balance out the risk if one of these activities fails.

ronmental strategy development

Definition/Description

Corporate environmental (management) maturity (CEMM) indicates how an ecological strategy of a firm develops in time with increasing integration of eco or green practices into the business strategy. According to Kolk and Mauser (2002), corporate environmental management can be labeled as strategies, approaches, responses, or development/maturity stages. Various scholars have proposed different taxonomical models to classify CEMM with different stages and characteristics. While some of these models are conceptual, others are based on empirical evidence. However, all these models indicate a development over time from a reactive approach to a proactive strategy of

environmental responses with different transitional stages.

Introduction

Businesses are compelled to enhance the responsibility of their activities to encompass both ecological and social considerations and focus on shareholder profit maximization (Buysse and Verbeke 2003; Gunarathne and Lee 2020). The growing regulatory and stakeholder pressures have resulted in changing corporate managers' attitudes to bring environmental sustainability matters into the decision-making processes of corporations (Newman et al. 2020). Hence corporate environmental strategy has become an integral component of companies' contribution toward corporate sustainability and sustainable development (Landrum 2018). However, evidence shows that companies have displayed different levels of adoption of environmental management practices (Jabbour et al. 2010; Gunarathne and Lee 2019a; Park and Ahn 2012), exhibiting a different degree of intensity in their application of environmental strategy. As Jabbour (2015) mentions, "not all organisations adopt all of these practices, nor do they apply them with the same level of intensity" (p. 332), which gives rise to the concept of corporate environmental management maturity (CEMM) (or environmental management development). It explains the different intensity levels in which corporate ecological management strategies can be implemented (Jabbour 2015; Kolk and Mauser 2002).

Corporate Sustainability

The concept of corporate sustainability is rooted in the broader concept of sustainable development. According to Brundtland Commission (1987), sustainable development is the development that meets the needs of the present generations without compromising the ability of future generations to satisfy their need. Following this famous definition, Dyllick and Hockerts (2002)

define corporate sustainability as the ability of a firm to meet the needs of its stakeholders (both direct and indirect) without compromising the ability to meet future stakeholder requirements. However, there is considerable disagreement about the concept and lack of clarity on how best corporate sustainability management practices should be implemented internally. Hence, Schaltegger and Burritt (2018) suggest that a firm needs to plan, design, measure, report, and control economic, social, and ecological activities to achieve corporate sustainability management. By doing so, firms will realize sustainable development for themselves and contribute to the sustainable development of the society and economy. Hence, corporate sustainability implies managing three types of capital, viz., economic, social, and environmental, which require a broader definition than typically used in economics or ecology (Bansal 2005; Dyllick and Hockerts 2002).

By managing economic, social, and ecological aspects, corporate sustainability reflects attempts of a firm to contribute toward the broader sustainable development agenda. Traditionally the businesses have focused on reaching a business case through their environmental and social sustainability practices. However, corporate sustainability requires attention being paid simultaneously to the “natural case” and “social case” while achieving a “business case” for sustainability (Dyllick and Hockerts 2002; Elkington 1997). Further, corporate sustainability highlights the need to address the growing concerns and long-term business models (Dyllick and Hockerts 2002; Schaltegger et al. 2016). It is thus essential for an organization’s business strategy to embrace sustainable development principles and concepts (Welford 2013). Thus, corporate response to ecologically sustainable development is witnessed in a firm’s environmental practices and strategy.

Corporate Environmental Management

Corporate environmental management denotes integrating business practices and the

environment (Ormazabal and Sarriegi 2014). It is now considered another essential strategy for businesses to meet the expectations of the various stakeholders such as governments, customers, investors, media, environmental pressure groups, and the public (Gunaratne and Lee 2019a; Ormazabal et al. 2017). Corporate environmental management is concerned with the minimization of environmental impacts caused by an organizations’ business operations through the active deployment of technical and managerial activities of an organization (Cramer 1998). Holding a similar view to that of Cramer, Bansal (2005) suggests that corporations make an effort to reduce the size of their environmental impacts. Over the years, various tools, frameworks, methods, and practices have been developed to support the companies to minimize their environmental effects to achieve environmental sustainability (Buysse and Verbeke 2003; Ormazabal and Sarriegi 2014). By using these various mechanisms, organizations have introduced environmentally sound (or green) practices into corporate strategies (Sarkis 2001). Due to the importance of environmental considerations, many organizations presently consider environmental management activities at a strategic level (Ervin et al. 2013). Corporate concern for environmental sustainability is manifested through different strategies with different environmental practices (González-Benito and González-Benito 2006).

Various reasons or motivations have driven corporations to pursue environmental management practices. By analyzing multiple motives in the extant literature, Windolph et al. (2014) group them into three categories: seeking legitimacy, achieving market success, and realizing efficiency (improvement) gains. Legitimacy, sometimes referred to as approval or acceptance, is the corporate ambition to be perceived as “desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions” (Suchman 1995, p. 574). On the other hand, motivations for market success are driven by the consumers who increasingly demand green or environmentally friendly products and processes that mitigate environmental impacts or investors

who require sound and sustainable corporate practices in their investment decisions (Miles and Covin 2000; Windolph et al. 2014). The next motivation for the corporation to follow environmentally friendly procedures is the productivity or efficiency gains that could be achieved through minimizing waste, saving energy, or reducing carbon emissions (Shrivastava and Hart 1995; Valentine 2010). In addition to these three motivations, additional drivers of corporate environmental sustainability have been suggested. They include managers' personal values, beliefs, and/or management commitments, group affiliation, environmental sensitivity of the industry, and company size (Valentine 2010). Depending on these motivations, a company may exhibit its commitment to contribute toward sustainable development (Windolph et al. 2014) at various levels. This leads to the classification methods of CEMM.

Corporate Environmental Management Maturity (CEMM) Taxonomies

Evidence shows that even the organizations that face similar circumstances do not follow corporate environmental management practices (activities, applications, or strategies) at the same level of intensity (Gunarathne and Lee 2019a; Jabbour and Santos 2006; Ormazabal and Sarriegi 2014; Roome 1992). It is often highlighted that some organizations exhibit advanced corporate environmental management practices by developing sophisticated processes and systems while other organizations in similar conditions even do not comply with the existing regulations or have fundamental environmental practices (Roome 1992; Gunarathne and Lee 2019a; Maialle and Jabbour 2014). Hence, scholars have suggested different classification methods to provide taxonomical explanations on the different approaches adopted by corporations toward environmental sustainability. By proposing different classification approaches, these taxonomies aim to schematize companies' strategies at the firm level in carrying out environmental management activities. Scholars such as Potrich et al. (2019) and Kolk

and Mauser (2002) broadly categorize these taxonomical approaches into two: a) evolutionary stage models and b) typological models.

Many scholars argue that these environmental classifications or taxonomies broadly reflect two models or categories:

- a) Developmental/Maturity/Evolutionary models
- b) Nonprogressive/Typology models (Kolk and Mauser 2002)

Developmental models assume an advancement of firm-level environmental activities from some primary stages to advanced levels over time. Hence, they provide an organizational classification depending on the extent of development or improvement of their environmental management activities (Ormazabal et al. 2017). Furthermore, these models assume an increasing level of integration of ecological management when a firm advances from some initial stage to advanced stage (Kolk and Mauser 2002; Hass 1996; Gago and Antolin 2004; Jabbour and Santos 2006; Gunarathne and Lee 2019a). On the other hand, the *typologies or nonsequential models* that characterize companies do not assume such growing responsiveness (Gago and Antolin 2004; Kolk and Mauser 2002). In the typological models, a movement is possible, but it is not inherent as in the stage models (Hass 1996).

Prior literature suggests that maturity models have become more popular among researchers. This can be attributable to several reasons. First, due to the growing environmental concerns and stakeholder pressures, organizations increasingly pay attention and devote resources to improve their ecological responsiveness. Second, if implemented with the right strategies, these efforts can advance an organizational environmental management activity to an advanced level. Hence, maturity models present a better reality of what the organizations aim to achieve (Gunarathne and Lee 2019a).

On the other hand, a large body of literature analyses various aspects of maturity models. For instance, many researchers have conceptually or empirically attempted to define and discuss the characteristics of different stages of maturity

models (Potrich et al. 2019). Similarly, another strand of research has examined the support and use of other functions within an organization. For example, Jabbour et al. (2010) have analyzed human resource management, Teixeira et al. (2012) have investigated the relationship between environmental management and environmental-related training. Further, Ferreira et al. (2017) have discussed supply chain management in the corporate EMM stages. Finally, Gunaratne and Lee (2019b, 2021) discuss how managers use environmental and accounting information in different maturity stages.

Characterization of Maturity Models

Table 1 highlights different stages in environmental management maturity models (see Table 1). It also shows no consensus about the number of maturity stages or the characteristics of each stage (Potrich et al. 2019). However, most methods advocate three or four stages (Jabbour et al. 2010; Murillo-Luna et al. 2011; Gunaratne and Lee 2020). Therefore, this chapter also follows a three-staged model in describing the characteristics of each stage. The three stages are: reactive, preventive, and proactive.

Reactive Stage

The primary stage of CEMM is often characterized by a motive to meet the external environmental regulations or internal company demands such as certification standards (Roome 1992; Gunaratne and Lee 2019a). Since the environmental management activities are designed in response to the regulations or certification standards, this stage represents a passive, reactive environmental management strategy (Roome 1992; Ormazabal and Sarriegi 2014). The environmental management practices at this stage can also arise due to social pressures (Jabbour et al. 2010). Reactive level organizations only pay attention to a few selected environmental considerations stipulated in regulations (or certifications). For instance, the majority of the reactive level organizations focus on waste disposal or emission reduction activities as they constantly

Corporate Environmental Management Maturity, Table 1 Different EMM stages

Author(s)	Maturity stages of environmental management
Hunt and Auster (1990)	Beginner, firefighter, concerned citizen, pragmatist, and pro-activist
Roome (1992)	Noncompliance, compliance, compliance-plus, leading edge, and excellence
Shrivastava and Hart (1995)	Band-aid, more serious, and deep change
Hart (1997)	Prevention of prevention, environmental management in products, and sustainable development
Buyse and Verbeke (2003)	Reactive strategy, prevention of pollution, and environmental leadership
Jabbour et al. (2010)	Functional specialization, internal integration, and external integration
Valentine (2012)	Low hanging cherries, cost-saving investments, revenue enhancement, and diminishing returns
Ormazabal and Sarriegi (2014)	Legislation fulfillment, training, systematization, eco ₂ , eco-innovative, and leading green company
Garces-Ayerbe et al. (2016)	Laggards, initiated, proactive, and eco-innovative
Primc and Čater (2016)	Reactors, defenders, analyzers, and prospectors

receive regulators' attention. However, as regulations are enacted passively and do not reflect the latest development in ecological thinking, reactive level organizations do not have a chance to strengthen their competitive position from environmental management practices. As a result, a few selected individuals or units often carry out environmental strategies and management practices. Hence, the environmental management of organizations remains isolated in this phase with a low level of top management involvement (Jabbour et al. 2010).

Preventive Stage

Many organizations will witness some benefits of their environmental management activities.

	Preventive	Proactive	Reactive
Focus of environmental management activities	Compliance with regulations or certification requirements	Initiation of projects to improve resource utilisation	Exploration of market opportunities to improve firm's competitiveness
Company attitude towards environmental strategy	Perceived as an additional burden	Considered as a tool to realise cost savings and improve resource utilisation	Means of differentiation and a source of gaining competitive advantage
Top management support towards environmental activities	Limited	Focused on improving eco-efficiency	Continuous
Stakeholder support for firm's conservation activities	Minimum and often limited to internal stakeholders such as employees	Starting to receive the support of several stakeholders	High level of support across the value chain

Corporate Environmental Management Maturity, Fig. 1 Profile of CEMM levels. (Source: Developed based on Gunarathne (2015) and Jabbour et al. (2010))

Hence, they will move into this phase of environmental management maturity after pursuing a reactive strategy. Some scholars call this stage a transitional phase, most similar to a “compliance-plus” stage (Roome 1992). During this stage, organizations embed certain green practices into their corporate strategies. Accordingly, organizations in this stage gradually increase their involvement in environmental conservation and management activities (Jabbour et al. 2010). However, most organizations specialize in one environmental management activity (Potrich et al. 2019). Therefore, these activities are not well aligned with other business operations nor systematically integrated into the business strategy (Gunarathne and Lee 2019a). Due to the realization of cost savings, management attention and support for environmental activities start to receive. This could act as a potential trigger for more organizational wide support and developments toward corporate sustainability (Roome 1992).

Proactive Stage

This stage represents an advanced CEMM status where a business organization improves its competitive position in the external marketplace through its ecological practices (Jabbour and Santos 2006). According to Roome (1992), this stage

is similar to an “environmental excellence” and “leading edge” stage. However, other scholars suggest that further developments are possible, so this stage is not a final destination (Gunarathne and Lee 2020; Potrich et al. 2019). Since these organizations have followed green practices over a period of time, advanced systems have been developed internally with the support of many stakeholders. On the other hand, environmental management activities have become a part of the corporate strategy, and environmental considerations and values are a part of the organizational decision-making system (Jabbour and Santos 2006). Hence, environmental considerations have become a routine practice and part of the regular corporate decision-making process.

Some of the salient features of these three stages are summarized in Fig. 1.

Summary

Organizations display different levels of intensity in carrying out their environmental management practices and strategies. Two broad taxonomical models are available to categorize these corporate environmental management strategies. They are maturity and typology models. The environmental management maturity models offer a firm-level

classification approach based on integrating an organization's environmental management practices. These models assume that the firm-level environmental management strategies develop over time from basic to advanced procedures. Scholars have provided various maturity models with different stages and characterization. Although there is no agreement on how a firm develops its environmental management practices over time, the typical approach follows a three-staged maturity model. These three stages are reactive, preventive, and proactive. These stages differ in green activities' focus, company attitude toward ecological practices, top management support, and stakeholder engagement.

Definition

Corporate family responsibility (CFR) is a company's commitment to the promotion of strategies and policies aimed at enhancing the workplace flexibility and facilitating employees' integration of work, family, and personal life. It rests on the idea that families and firms are not only "private goods" but "common goods," and considers the family a company's stakeholder. While corporate social responsibility (CSR) refers to the general and broad companies' responsibilities toward their different stakeholders, the environment, and the society at all, CFR is the specific responsibility toward companies' employees and their family community. Work-life balance (WLB) and employees' wellness policies are among the main tools for CFR implementation in both large companies and small and medium-sized enterprises (SMEs). CFR is thus understood as the specific manifestation of truly "family friendly" company policies that consider the family of a company's stakeholders and assume the WLB a strategic lever for personnel management and the CSR approach. When CEOs (chief executive officers) and entrepreneurs implement family-friendly policies, they increase both personal and professional productivity levels and reduce stress factors with positive impacts on performance. Therefore, CFR may be considered a potential driver for company's success (Tomaselli 2017).

Introduction

Corporate family responsibility (CFR) is an emerging topic within the corporate social responsibility (CSR) debate. Currently, a limited amount of studies has addressed this issue (IESE 2008; Fondazione Marco Vigorelli 2012; Strandberg 2009). However, in the last decade, companies have been progressively directing their attention to CSR policies addressed to employees, who represent the most relevant internal stakeholders' category internal stakeholders. Among these, work-life balance (WLB) policies play a critical role because they affect the internal organizational

climate as well as company's productivity. Prior studies pointed out that the diffusion of CSR is important for effective work-family balance policies aimed to reconcile people's work with private life, that is, work with responsibility toward one's family (Werbel and Walter 2002; Donati and Pradini 2006). The demand for such policies (Ponzellini and Tempia 2003) is increasing. The need for a balance between work and family responsibilities is associated with a higher quality of life (Greenhaus et al. 2003) and has been particularly acute starting from the increase in female employment (Catalyst 1998) and the changes in family's life cycle (Waismel-Manor et al. 2002).

Considering the family as a corporate's stakeholder means to deepen the CSR orientation toward employees stressing the advantages deriving from a better working environment, an employees' working in cohesive social contexts, a high level of solidarity and social control, and a social fabric that is economically and culturally rich. It thus implies that companies should attribute a plurality of meanings to work-related activities (Cartwright and Holmes 2006) and consider employees not only as economic resources but adopt an integral vision of development by considering employees and collaborators as people who are a key part of a rich fabric of interpersonal relations, starting from their family. Over-exploitation attributable to the increased intensification of labor and noncontrollable time investments produces strain among the employees and leads to conflicts in families and sometimes to family breakdown (Hochschild 1997; Rimashevskaya et al. 2017). Family is a "nexus" of relationships that has "its own needs" affecting employees' professional and personal life. Accordingly, the family should be considered as a relevant stakeholder in governing and managing a business (Faldetta 2008).

Key Issues

The theme of CFR is not particularly developed in the business economics literature and has emerged only recently within the CSR discourse. This topic crosses diverse disciplines and points of view

(economic, sociological, ethical, organizational, legislation, and anthropological) and is significant on both the theoretical and practical levels, because the need to balance work and family must be responded to with concrete instruments and policies aimed at improving the relationship between quality and satisfaction in both work and life. The growing need for effective policies to reconcile work with familial responsibilities has been pointed out by several studies (Fischer et al. 2000; Cartwright and Holmes 2006; Kodz et al. 2002; Yeandle et al. 2002), particularly for flexible hours, part-time and smart work, paid or unpaid parental leaves of absences and smart work (Bombelli 2003; Ponzellini and Tempia 2003; Eberhard et al. 2017).

In searching for a coherent perspective (Werbel and Walter 2002) the diffusion of CSR policies and practices becomes a fundamental driver to trigger effective work-family balance policies. In this regard, to date the emphasis has been mainly attributed to equal opportunity policies and diversity management and their positive impact on company outcome (in terms of reputation, internal climate, reduction of conflicts, improved productivity, etc.) while less attention has been put on the relation between WLB policies and the improvement of firm performance (Greenblatt 2002; Glass and Finley 2002).

Namely, the nexus between economic performance and work-family balance policies has not been adequately deepened and most of the policies currently adopted by corporations are oriented toward resolving short-term problems and immediate needs, and it is often difficult to identify and assess the longer-term economic benefits. This is attributable to the fact that the will and the opportunity to implement such policies cannot be determined only by economic reasoning (Butler et al. 2004).

A link between formal instruments (i.e., flexible work hours used to support employees in facing their family needs) and soft organizational factors (i.e., the organizational culture) has been proved by some empirical researches (Grover and Crooker 1995; Allen 2001; Anderson et al. 2002; Behson 2002, 2005). Indicators adopted to measure the personnel's morale, commitment,

production, and absenteeism demonstrate that there exist economic benefits deriving from the implementation of work-family balance tools. Managers seem to be more aware than their employees of the importance of these results (Kodz et al. 2002). Moreover, some studies pointed out that effective policies concerning the work-family balance positively impact on the quality and satisfaction of people both in their work and in their private life (Kapitány et al. 2005; Prandini and Tarroni 2005; Bould and Crespi 2008; Crespi and Bould 2008).

An in-depth analysis based on five companies that have introduced CFR practices, carried out through semi-structured interviews addressed to their CEOs, reveals the success of such policies in terms of both tangible and intangible benefits resulting from a growing attention of the top management toward the topics of CFR and work and family balance (WFB) policies (Tomaselli 2017) that overcomes the traditional sensitivity toward CSR and WLB policies. These initiatives have a more significant impact on women and positively affect their integration in the socioeconomic framework, particularly attributable to a reduction of reintegration time after maternity leaves (Bevan et al. 1999; Rode et al. 2002). Among the benefits for all the employees (both men and women) deriving from the implementation of WFB policies are: the increased employees' productivity, a growing length of employment (loyalty) and a turnover reduction, an increase in effectiveness of personnel selection and hiring procedures, a reduced resistance to change and a growth in creativity and individual contribution to innovation; an improved company's attractiveness (in terms of employer branding) (AIDP 2010).

Currently, family policies adopted by various states are diverse (Dex and Smith 2002; Fagan 2003; OECD 2002–2005, 2007) ranging from counties systems of social assistance that include an ample range of benefits and services for families (particularly diffused in Northern Europe) to countries where the benefits are scarce, that is, healthcare services for children and parents are inadequate, and there are more stay-at-home mothers (i.e., in Italy).

An empirical research carried out by the International Center for Work and Family (ICWF) at IESE Business School (Spain) aimed to assess the efforts spent by public and private organizations to favor a balance between work and family (IESE 2008) elicited to depict four different models of companies. “Systematically enriching corporations” distinguish themselves for a high level of responsible family culture; “discretionally enriching corporations” are those companies characterized by the presence of some WFB policies, while in “discretionally polluting” companies the aforementioned policies formally exist but are rarely adopted; finally, “systematically polluting” companies are those in which responsible family policies are definitely absent. Data pointed out that through WLB actions companies can increase employee productivity and enhance their creativity and loyalty (Chinchilla and Jimenez 2014).

According to the aforementioned research in 2009 the Italian Ministry of Equal Opportunity promoted a survey on 216 businesses, including both SMEs and large companies. Results pointed out that most of Italian companies were included into the “discretionally polluting” category. Only 2% were categorized as “systematically enriching” companies, thus pointing a gap compared to other countries. However, best practices of CFR have been developed under the General Directorate for Social Welfare and Family Policies at a regional and local level. One example is provided by the Region of Lombardy, which has placed the issue of reconciliation between family and work at the center of its policy agenda. Accordingly, in 2011 the regional public administration released a White Paper and developed a Roadmap to support the reconciliation of family and work life, implemented in 12 provinces.

Moreover, in Italy the “Marco Vigorelli Foundation” – FMV was set up in 2002 to promote the culture of company welfare and the diffusion of CFR at a scientific and managerial level. The Foundation’s mission is to deepen the knowledge of CFR and spread best practices based on the intuitions of the Milanese economist Marco Vigorelli about the close and non-negligible

relationship existing between business and family. The balance in the relationship between private life and work has always been considered a core topic for its social criticality and the delicate dynamics that it generates since too often it pushes mothers and fathers, especially if they are both committed to work, to put into practice not always successful balancing acts with the aim of not negatively affecting family relationships, that is the most valuable asset that the WLB and the most responsible companies try to preserve. Starting from the last decade the Foundation organizes an annual award addressed to post graduate and doctoral theses (young scholars) devoted to deepen the knowledge of CFR and spread best CFR practices, tools, and models. Recently the Foundation has started to publish the research on this topic in a specific series “the FMV-Corporate Family Responsibility Quaderni.” A multidisciplinary research project titled “CFR: a relational approach” was started a few years ago with a work team composed of sociologists, economists, and managers and aimed to link theory and practices among Family Responsible companies interested in testing the methodology for measuring the relational effects of CFR policies.

Future Directions

Corporate welfare, intended as the dimension of employee well-being and the sustainability of WLB in the broader framework of human resource management policies is included among the Sustainable Development Goals (SDGs) articulated in the numerous targets to be reached by 2030, according to the lines envisaged by the Agenda approved by the UN. Namely, it refers to company organization features with a focus on labor flexibility models, the relationship between WLB and new ways of performing tasks and identifying good practices and possible developments of these organizational settings.

According to these goals, the relevance of CFR emerges since there is a strong interdependence between family and work. To recognize this

interdependence as a dimension of sustainability is a key goal for companies, called to support employees' families, favor men and women participation to the labor market and enhance both human and relational capital. It is a question of considering the family as a bearer of interest towards (and for) the company, namely as a stakeholder. In other words, the issues lie in making companies aware that understanding the families' needs and supporting the efforts of families is not just a question of paying attention toward their employees, but considering the value of their familial relationships. This means making a further shift and "go beyond" through the implementation of family-friendly practices capable to transform a criticality into an opportunity, both for the employee – as the beneficiary of the conciliation interventions – and for the company that can count, therefore, on people "healthy carriers of relations". Neurosciences tell us that being new parents improves some important skills pointing out that the values of relational dynamics generated outside the workplace improve and make professional skills flourish, such as organizational and motivational abilities, innovation, and creativity.

CFR is therefore a new perspective that is gaining momentum within the CSR discourse related to economic, legal, psychological, and social features that positively affect companies' success. The advantages of CFR policies have been only partially assessed because most of them are intangible in nature and cannot be expressed through financial metrics. Moreover, benefits can be carefully appreciated only in a long term view. An effective CFR strategy should be based on a company's mission and governance system consistent to a "family-based orientation" that allows the implementation of tools capable to positively affect both work and life (Donati and Prandini 2008). In this regard, companies led by ethical motivations are aware that CFR policies represent an opportunity to improve both the personal and family quality of life, as well as the quality of the work environment and the organizational culture. Moreover, they are aware that the relative investments call for a cost/benefit analysis

capable to take into account both tangible and intangible outcomes.

Summary

CFR can be considered an innovative approach of business ethics and an essential component of CSR (Tomaselli 2019) whose theoretical framework is based on the idea that families and firms are "common goods" (Pulvirenti 2013). CFR policies posit a supportive corporate culture and find a fertile ground in companies that consider human capital, trust, and reciprocal loyalty (Roehling et al. 2001) as drivers of social and economic value. Drawing from the theory of human ecology CFR calls for a change of the cultural context through policies affecting both the individual and the organizational level aimed to balance and reconcile family and work life needs. On the one hand, the work-family conflict and stress in managerial and dual career-families require a work-family decision making in individuals and firms. On the other hand, it implies that companies implement human resources policies based on CFR initiatives (such as the experimentation with flexible incoming and outgoing timetables; vertical and horizontal part-time; job sharing; job rotation; smart work; professional and personal counseling, etc.) to change the organization culture and pursue a company management model familiarly responsible.

Viseu, Viseu, Portugal

Synonyms

Business corporate finance; Finance corporate

Definition

Zingales (2000) defines corporate finance as the study of the ways in which companies finance themselves. The adjective corporate serves to define the difference from other areas of financing, such as real estate financing or personal/individual financing. Hence, corporate finance encapsulates financing a business – not just an asset or an individual but rather the unique combination of assets and individuals that make up companies. The meaning of the verb “to finance” is “to raise or provide funds or capital for.” According to the aforementioned author, corporate finance covers three fundamental areas: capital structure, corporate governance, and evaluation.

In turn, Aswath (2001) incorporates into corporate finance: resource allocation (investment decisions), investment financing (decisions on capital structure), and whether the resources generated should be reinvested or distributed (dividends). In a more recent contribution, Faff et al. (2016) identify seven areas making up corporate finance: capital structure, payout policy, cash holdings, initial public offerings, seasoned equity offerings, mergers and acquisitions, and corporate governance.

In perfect markets, Modigliani and Miller (1958) argue that resources would flow freely. However, agency problems, information asymmetry, moral hazard, adverse selection, tax, and transaction costs weigh on financing and generate

market imperfections (Foley and Manova 2015; Stein 2003).

Introduction

According to Aswath (2001), companies deploy resources through allocating financing to meet different needs. The main function of corporate finance involves allocating resources in the most efficient possible way. Hence, investment decisions require the inclusion of not only sources of income generation (e.g., the introduction of new product lines or market expansion) but also means of saving resources (e.g., the development of more efficient systems). These also extend to the credit policies, backup inventory, and cash reserves traditionally included in working capital, which ultimately also constitute investment decisions. Within the scope of strategic decisions, investment decisions take on important roles and include the acquisition of non-current assets, the acquisition of other companies or seeking out new markets, for example. These decisions only compound the need to assess their profitability and compare them with a minimum acceptable reference rate of return with similar levels of risk for projects to appear attractive. This should include compensatory spreads for projects involving additional risks while also reflecting the financing structure deployed, i.e., own funds or debt regardless of the respective amounts.

In the case of companies listed on capital markets, debt might take the form of securities (usually ordinary). Private capital companies prefer instead to resort to the banking system and/or their owners. The fact that firms finance themselves through recourse to external capital and equity determines the average cost of capital necessary to maximizing the respective firm's valuation.

As regards the dividend policy, companies want investment opportunities providing surplus returns. However, the company only generates cash flows during certain life cycle stages that outweighs the need associated with good investments. Only under these circumstances are the conditions in effect for the company to return

surpluses to the owners of the capital. In private companies, this may translate into the scope for the owner withdrawing a proportion of the resources allocated to the business activity. In public companies, this translates into the payment of dividends or share buybacks.

Faff et al. (2016) present a more comprehensive approach to corporate finance by encapsulating a number of aspects that involve corporate activities more generally.

First of all, the capital structure and the broad debate established around the two core theories: trade-off and pecking order. According to trade-off theory (Modigliani and Miller 1963), the value of companies increases proportionately to their level of indebtedness as a result of the economies generated by the tax-deductible nature of interest paid on debt. However, higher levels of debt generate financial distress and greater probability of bankruptcy. According to this theory, companies should correspondingly seek to attain optimum levels of indebtedness. In turn, pecking order theory suggests that firms prefer internal financing to external financing (debt to equity when the firm issues bonds with different transaction costs driven by the asymmetric information between insiders and outsiders) (Myers and Majluf 1984).

In terms of payout policies, companies may either distribute dividends or repurchase shares. Dividend decisions consist of ascertaining the optimal volume of distribution for the results that still ensures sufficient self-financing – in support of investment decisions – and sufficient returns on company shares – able to increase their market values. The optimal dividend policy provides shareholders in general with the right balance between dividends and future company growth and therefore maximizes the market value of shares (Chu 2017). However, this is also susceptible to the influence of a number of factors such as the respective shareholder structure and management control, the informational value of the dividend announcement, the need for stable income, liquidity, the fiscal position of shareholders, leverage, profitability, size, and risk (Kaźmierska-Jóźwiak 2015; Yusof and Ismail 2016). When there are no obvious tax advantages to any of these strategies, share buybacks may

represent the rightful replacement for dividend distribution and correspondingly the option adopted in many countries (Au Yong et al. 2014; Brown et al. 2015).

In relation to cash holdings, three questions arise: what are their determinants, what is their ideal amount, and, finally, how to evaluate the sensitivity of the investment to the cash flows generated (Faff et al. 2016). The literature states two core reasons for firms to maintain a certain level of liquidity: with a precautionary motive related to future financial constraints, and with an agency motive related to the imperfections resulting from the dispersed ownership of publicly traded companies (Amess et al. 2015).

As a prerequisite to initial public offerings (IPOs) and seasoned equity offerings (SEOs), companies require strong incentives to raise their values and maximize results. For example, Liu et al. (2014) report that issuers experienced strong incentives to manage their IPO results and obtain higher offer prices prior to the abolition of the regulated pricing system in China. However, underpricing, defined as the difference between the offer price and the trading price on the first day, represents a frequent occurrence in these transactions.

The key discussions about mergers and acquisitions revolve around the following question: do companies enjoy a premium when they diversify their activities or, on the contrary, do they lose value (Faff et al. 2016)? In this context, two studies of Australian companies return contrasting results. On the one hand, Fleming et al. (2003) report that companies that diversified their portfolio decreased in value between 1988 and 1998; on the other hand, Choe et al. (2014) conclude that diversification generated a premium in the sample of companies they surveyed between 2008 and 2014.

At the corporate governance level, recent studies focus on how managers create or destroy company value. Managers are able to contribute to the creation of value in accordance with their acquired experiences (Gray and Nowland 2013) when: their level of specialization matches the business areas of companies (Gray and Nowland 2017), when female, given that female managers

demonstrate a greater capacity to moderate excessive company risk levels (Hutchinson et al. 2015), when the need expressed by companies at the level of consulting and high level financing (Lee and Lee 2014) and whenever there are cuts to the excessive remunerations they receive (Cheng et al. 2012).

Another relevant issue arises out of the ways in which financial intermediaries shape corporate governance activities. As a result of the information asymmetry to which creditors are subject to, problems of agency intensify to generate a number of aspects that are worth highlighting: (i) the difficulties encountered by owners and creditors in supervising company activities, (ii) managers or large investors pursuing “private benefits”; (iii) the difficulties of external agents in accordance with the scarcity of information represents a sufficiently strong threat to significantly alter the way management takes place; and (iv) in more monopolistic sectors, competition remains insufficient and thereby fostering more conservative systems of governance (Caprio and Levine 2002).

Within the scope of corporate finance, information asymmetries, moral hazard, and adverse selection condition the ability of firms to finance themselves (Jensen and Meckling 1976; Myers and Majluf 1984). Moreover, according to La Porta et al. (2008) and Levine (2005), in keeping with rising levels of capital market efficiency, companies display an increasing likelihood to resort to these types of markets.

In the credit market, the presence of information asymmetries occurs when companies have private and exclusive information regarding their intrinsic characteristics and the particular nature of their projects that are difficult to convey to creditors. This situation enables companies to define their strategies with some flexibility but resulting in some difficulties for the banking system in seeking to distinguish between different credit proponents (Langlais 1999). This leads to adverse selection that prevents banks from practicing differentiated interest rates and, in short, credit agreements adjusted to the actual risk levels of their proponents. Creditor difficulties in telling “good” from “bad” companies drive greater difficulties in accessing credit for the former when the

presence of the latter is significant (Stiglitz and Weiss 1981).

On the other hand, the creditor bank may find control difficult after signing the credit agreement with company behavior causing so-called moral hazard. Under these circumstances, banks as a rule then require higher interest rates and guarantees and impose more restrictive clauses. This problem is witnessed particularly in SMEs and often leads these companies giving up on good investment opportunities thereby restricting their performances (Degryse et al. 2004).

In recent decades, financial markets have experienced expansion thanks to a number of factors, including: increased exchange rate and interest rate volatility, market globalization, regulatory changes, financial innovations, and the development of derivative products (Krippner 2011). Expanding financial activities returns greater opportunities for the sharing of risks and drives innovations, large-scale investments, and economic growth. However, expansion has also widened and clouded risks in an increasingly opaque and complex system fraught with conflicts of interest (Partnoy 2003; Zingales 2015).

Key Issues

The study of financial decisions, investment, financing, and dividends, involves evaluating the effect they have on company value and consequently on shareholders wealth. Just as investment decisions shape the economic structure of the assets so do financing decisions determine the capital structure. Correspondingly, dividend policies determine company behaviors vis-à-vis their owners in deciding just what proportions of results are retained for investment purposes and those for distribution to shareholders (Miguel Hidalgo and Palenzuela 1990). According to these authors, financial decisions must emerge out of a simultaneous process resulting from company existing interdependently with market imperfections and with the consequences necessarily leading to partial and ongoing adjustments to long-term financial objectives.

According to San-Jose et al. (2013) the study of corporate finance incorporates two different

perspectives. The first approaches the financial decisions that managers take in order to make them more efficient; the second pertains to investor behaviors in financial markets. The impact of financial decisions on company values is influenced by the decisions managers make in terms of the retention, distribution, and allocation of financial resources. The financial function strives to capture the financial resources capable of creating value for the company (Ross et al. 2005). In turn, financial market theories focus on consumer behaviors and the selection of investment portfolios and asset valuation models, often within the framework of perfect capital market theory.

The scope of corporate finance intervention has undergone significant changes due to a set of factors that impose limits on its activities: information and communication technologies, financial globalization, uncertainty, speculation, and the fact that forward looking management is an increasingly important area encountering increased difficulties in keeping with traditional financial theories and hence the witnessing of dynamic behaviors. To this end, Tirole (2006) Van Horne and Wachowicz (2008) all report that corporate finance has changed significantly in the twenty-first century.

In the traditional world of finance, financing was studied only within the scope of liabilities. However, the modern concept takes into account the relationship between the return on assets and the cost of financing. Dividend policies, liquidity, and solvency have gained increasing relevance as business management mechanisms (Suárez 2014). From this point onwards, investment and financing-related issues and problem have required simultaneous analysis. New investment project selection methods and techniques have been developed so as to ensure more efficient allocations of capital within companies.

Profitability/risk analysis (particularly specific risk) experienced strong development in the 1960s following the development of the Capital Asset Pricing Model (CAPM) and the option value problem received a major contribution in 1970 with proposal of the Black-Scholes model (San-Jose et al. 2013).

In light of the above, the main aspects that have gained growing relevance in the field of corporate

finance are: (i) the financial structure of companies takes into account analysis of profitability/risk (Sanchís and Riberiro 1999); (ii) the relevance of the debt policy should incorporate updated market requirements and including interest rate (Suárez 2014), asset valuation based on interest rate risk, and the progressive usage of hedging instruments such as swaps, FRAs, futures, and options (Soldevilla 1988).

In recent years, corporate finance has become an integral part of strategic business management (San-Jose et al. 2013). For example, recourse to real options as a methodology for evaluating real investments alongside the efforts made to incorporate market imperfections into the study of different areas: taxes, transaction costs, and information asymmetry (Amram and Kulatilaka 2000).

Simultaneously, company financial resources require management not only actively but also predictively, thus incorporating the anticipation of those variables determining financial decisions and despite the fact that the models applied make significant recourse to historical data in efforts to pre-empt facts that did not previously occur (San-Jose et al. 2013).

How Do Sustainability Considerations Influence Corporate Finance Decisions?

The issue of sustainability as a growth phenomenon is rapidly entering in the economic and financial literature. Initially, the concept was linked to the environmental issues that took place at the United Nations in the 1970s and 1980s. The key concept of sustainability is associated with the explicit link that must prevail between present and future generations. The concept of sustainability in corporate finance addresses two issues. First, the question arises as to whether corporate finance is capable of meeting the needs of “future generations” (pension fund policy is a great example); secondly, long-term integrity and trust are ensured (Soppe 2004).

In the field of corporate finance, business sustainability encompasses the efforts of companies to limit their negative effects on the environment, local communities, and society in general, while generating benefits for owners and the economy.

A relevant issue arises from the sustainable competitive advantages reflected in the fact that companies survive and thrive in a competitive environment in the long run (Lev 2017).

Summary

Corporate finance focuses on studying the sources of financing, capital structure, financial contracts, and evaluating the investments that result from interactions between managers and investors. Its main concern is the taking of decisions that foster a balance between risk and profitability while maximizing business value. These decisions therefore fall into three broad categories: investment decisions, financing decisions, and dividend policy which, in accordance with modern financial theory, requires simultaneous analysis. The core areas of intervention span the capital structure, dividend policy, cash flow management, initial public offerings (IPOs), seasoned equity offering (SEOs), mergers and acquisitions (M&A), and corporate governance.

A fundamental issue in corporate finance derives from the efficient allocation of scarce resources to the different projects that companies aim to carry out. Interlinked with this issue, financial risk management has played an important role in considering the importance of protecting company value from a range of adversities, in particular credit risk, market risk, exchange rate risk, interest rate risk, among others, using hedges (sets of financial hedging instruments).

In perfectly competitive capital markets, as Modigliani and Miller (1958) expressed it, the number of participants is significantly high, ensuring that single factor may act upon the price of the market traded securities. However, in the real world, most financial decisions take place in situations in which markets are not necessarily efficient. Some of the features present in these markets arise from asymmetries of information and transaction costs leading to market participants lacking due awareness of the likelihood of risk and the profitability of securities, with imperfect competition and resource constraints prevailing at the level of both resources and investment opportunities.

New challenges have arisen in corporate governance, particularly with the emergence of behavioral finances as it is now perceived as imperative to incorporate the influences of the psychological, cognitive, emotional, cultural, and social dimensions into the decisions of investors, professionals, and subsequently into markets.

Definition/Description

Corporate governance is a term used to describe accountability and control of business organizations, including the legal corporation. There are both broad and narrow definitions. A broad definition includes not only internal organizational structures and processes, such as the board of directors and members, but extends to include markets, employees, regulators, and other stakeholders (Hopt and Teubner 1984). A narrow definition limits the term to the interaction between at least the two decision-making bodies in the legal corporation, namely, the board of directors (Coffee 1986; La Porta et al. 2000; Shleifer and Vishny 1997).

Corporate governance is an interdisciplinary study (Clarke 2017). The topic is an area of analysis and research in law, economics, sociology, and management studies. The different disciplines examine rights and duties (law), incentives and efficiency (economics), norms and organizations (sociology), and decision-making and performance (management) in relation to corporate direction and control. As an interdisciplinary area of research, results of corporate governance research can be difficult to reconcile and synthesize due to methodological incompatibilities.

Of particular interest to economic analysis of corporate governance are four specific markets – the market for finance, the market for management talent, the product market, and the market for corporate control. Each of these markets exerts pressure on the management constraining some decisions while facilitating others. Further, each of these markets is subject to analysis by the different disciplines mentioned earlier.

Introduction

Corporate governance, although a term initially used in the 1970s, came to prominence in the early 1990s as governments sought to address a series of collapses and scandals of that era (Clarke 2017). Rather than turning to regulatory solutions

generated by government, businesses advocated self-regulatory approaches using codes. These corporate governance codes have become common practices around the globe. They combine basic legal concepts such as directors' duties and shareholders' rights with broader ideas of business ethics such as fairness and taking account of stakeholder interests.

Historical Background

The challenges of holding company authority accountable are not a new problem. It goes back to the earliest corporate law cases of the medieval era. In recent times, however, as corporate executives became increasingly powerful in the mid-twentieth century, with CEO's selecting board members who in turn set compensation packages and were to provide strategy and oversight, the need for protection of the interests of the company, its shareholders, and the broader public interest became increasingly important on a new scale (Conrad et al. 1971). While this phenomenon was of concern, it was only a series of scandals and problems that occurred in the late 1980s that regulators and financiers put significant pressure on companies to improve governance. In essence, they wanted to focus attention on senior executives to ensure that they were discharging their duties and fulfilling their roles in the best interests of the company. The basic premise was that directors needed to ensure their companies were run in a proper manner so that the business could be successful.

In the UK, the "The Committee on the Financial Aspects of Corporate Governance" issued report titled *Financial Aspects of Corporate Governance*. That report became known as the Cadbury Report, after Adrian Cadbury, the chair of the committee, became a standard for the development of subsequent corporate governance codes. In that report, corporate governance was defined as follows: "Corporate governance is the system by which companies are directed and controlled" (Financial Reporting Council 1992).

As noted, the landmark Cadbury Report spawned the UK's corporate governance code and further developments around the world. One of the most influential codes has been issued by the OECD. Initially published in 1999 as the OECD's *Principles of Corporate Governance*, it has been developed and amended and now named, the *G20/OECD Principles of Corporate Governance*. The latest iteration of the Principles defines corporate governance more broadly, elaborating it as follows:

Corporate governance involves a set of relationships between a company's management, its board, its shareholders and other stakeholders. Corporate governance also provides the structure through which the objectives of the company are set, and the means of attaining those objectives and monitoring performance are determined. (G20/OECD)

Issues

The range of issues considered, researched, and regulated under the umbrella term "corporate governance" is broad and varies across jurisdictions. These issues are listed below as a set of questions followed by the general scope of answers:

Ownership. Who are the owners and what rights do they have? Owners may be long-standing insiders, such as family groups, or anonymous shareholders in public stock exchanges. Their rights range from direct powers of appointment to mere rights to receive information.

Control. Who has control rights? Parties that may have control rights can include insiders, owners, creditors such as banks, or employees through representative bodies such as found in supervisory boards of two-tier board models.

Law. What laws apply? And, what model of law is used? The focus of much legal discussion is on directors' duties and shareholders' rights. Directors, shareholders, and others may have very diverse rights under different jurisdictions. For example, while some jurisdictions may impose strict disciplining duties and

create extensive supervisory rights for regulators, other jurisdictions may grant rights to shareholders and expect them to exercise those rights as they see fit.

Finance. What choices are preferred and to be considered optimal? Different jurisdictions and industries will have different preferences for debt/equity ratios. The preferences involved as well as the control of those decisions are matters of corporate governance.

Growth. What is the best way to grow the business? Some locales place a strong emphasis on organic growth – the development of the business through its own efforts with its own resources. Other locales look to grow via merger and acquisition activity.

Takeovers. Are takeovers done amicably between collaborating or related companies? Or, are takeovers hostile? Where businesses are under threat from hostile parties, executives will operate the business differently and develop defensive strategies to avoid such takeovers. There is evidence that with the threat, executives will be encouraged to be more efficient with the use of resources.

Orientation. Should the corporation be governed to generate short-term profits or long-term growth? The answer to this question depends on the owners' goals and the environment in which the business is operating. Businesses operating in short-term share markets are under great pressure to generate short-term profits regardless of the long-term consequences.

Business Strategy. Should the business be focused on competitive strategies to drive share price? Alternatively, businesses can focus on production, quality, and sales volume. Such strategic decisions are intimately connected to corporate governance focus and rights.

Stakeholders. Are stakeholder interests important? Some systems ignore all stakeholders other than the shareholders. Other systems require corporate governance to attend to the interests of other parties such as employees, suppliers, and customers.

Codes and Principles

As noted, many of the solutions to corporate governance problems have been consolidated into codes. These codes are adopted by regulators, including stock exchanges, to provide guidance to companies about how their governance arrangements and processes are expected to be organized and carried out. The codes are often voluntary, particularly in the common situation where they are only applied to companies listed on stock exchanges (Aguilera and Cuervo-Cazurra 2004; Haxhi and Aguilera 2014; Sheehy 2019). In addition, they usually provide a wide range of discretion for executives in their implementation. The premise behind this wide discretion is that companies differ significantly in their industry, organization, strategy, and location and accordingly need discretion to effectively and efficiently respond to that context. This approach has been combined with the accountability obligations of corporate governance through a widely adopted approach to disclosure known as “comply and explain” (Keay 2014). Generally speaking, this approach, first expounded in the Cadbury Report, allows companies to either comply with the provisions of a code or explain why they have not complied, with the idea being that reasonable, legitimate explanations for non-compliance exist and may be more appropriate than needless, costly compliance.

While a variety of different codes exist, they all generally address the same issues. An exemplar is the G20/OECD Principles of Corporate Governance mentioned above. That instrument codifies six broad principles. These are (1) setting up a proper governance structure; (2) ensuring fair treatment of shareholders and appropriate rights; (3) proper dealings with institutional investors; (4) addressing stakeholder interests appropriately; (5) disclosure and transparency, and (6) clarity on board responsibilities. For a critical analysis, see Siems and Alvarez-Macotella 2015.

Theories

The range of theories to address these issues is as broad as the range of the issues themselves. Economics focuses on the conflict of interest between self-interested utility maximizing managers and owners. It contributes two significant theories: agency theory and transaction costs. Agency cost theory examines how executives as agents of owners (often mistakenly equated with shareholders) can exploit their superior knowledge to their own advantage and to the disadvantage of their principals/owners (Fama 1980; Panda and Leepsa 2017).

Transaction costs are the costs involved in carrying out exchanges (Coase 1937, Coase 1960). These costs include the costs associated with finding goods and services, negotiating for them, developing contracts, and enforcing such contracts. Transaction cost analysis examines the preference for hierarchical firms over open markets and particularly the role of bounded rationality and opportunism in firms.

Economics proposes a variety of solutions to these corporate governance problems based on aligning economic incentives in order to address the corporate governance challenges as set out in these theories.

The sociology of organizations offers different lenses on the problems of corporate governance. Rather than a focus on self-interest, this approach is focused on coordination to achieve organizational goals. In this vein, organizational studies take a stewardship approach and may include resource dependence (Pfeffer and Salancik 1978) or path dependence (Pierson 2000).

Stakeholder theory, appearing in both disciplines of management and law, views corporate governance as a means of coordinating groups of variously interested parties. These parties might be motivated by wages, brand loyalty, community well-being through stable employment, consumer activist agendas, organizational objectives, and a range of other matters (Blair and Stout 1999; Clarke 2016; Donaldson and Preston 1995; Freeman 1984; Sheehy 2005).

Law provides a range of solutions on the basis of distribution of rights and duties. These rights and duties are distributed among the parties to the corporation and need to be adjusted either by the state through prearranged corporate rules or by negotiation by the parties to the private constitution of the company (Sheehy 2004, 2006; Sheehy and Feaver 2014).

Summary

Corporate governance is a wide-ranging investigation into the systems of corporate control and accountability. It is a dynamic, multidisciplinary area of investigation and a paramount concern to investors, regulators, and other stakeholders who rely on effective corporate governance for products, services, and even pensions as retirement funds are increasingly directed to investment in stock exchanges around the globe.

[Corporate governance approach](#)

Definition

The perspective of corporate governance is determined by the ultimate goal that the corporate governance system aims to achieve. The shareholder perspective advocates that the sole aim of corporate governance is to maximize shareholder value to protect the interests of shareholders. By contrast, under the stakeholder perspectives, the corporate governance system should be aimed at guaranteeing the interests of all the firm's stakeholders. Both perspectives should be regarded as complementary approaches, rather than competing positions. The stakeholder perspective broadens the scope of corporate governance. It supports that corporate governance systems should consider and balance the interests of all stakeholders, in which shareholders are a

constituency with legitimate rights as those held by the other stakeholders. Additionally, the consideration of stakeholder interest could be used as an instrument to legitimize the corporation, hence contributing to maintaining its existence for shareholders.

Introduction

The current UK Corporate Code (Financial Reporting Council, 2018) conceives corporate governance as it was originally defined in the 1992 Cadbury report. According to this report, “*Corporate governance is the system by which companies are directed and controlled. Boards of directors are responsible for the governance of their companies. The shareholders’ role in governance is to appoint the directors and the auditors and to satisfy themselves that an appropriate governance structure is in place. The responsibilities of the board include setting the company’s strategic aims, providing the leadership to put them into effect, supervising the management of the business and reporting to shareholders on their stewardship. The board’s actions are subject to laws, regulations and the shareholders in general meeting*” (Cadbury report, paragraph 2.5, emphasis added). This traditional definition of corporate governance regards shareholders as the sole constituency to whom managers should be accountable.

Although the shareholder conceptualization of corporate governance is still advocated by some academics and regulators nowadays (e.g., the abovementioned 2018 UK Corporate Governance Code), there is different approach to how corporate governance should be understood. Since the beginning of the 2000s, there has been several calls to broaden the scope of corporate governance, arguing that it should be a framework that governs “the structure of rights and responsibilities among the parties with a stake in the firm” (Aoki 2001 p. 11, emphasis added). Thus, all the constituencies that have a legitimate interest or are involved in the corporations, and not only shareholder, should be the focus of corporate governance. Letza et al. (2004) argue that each

alternative corporate governance perspective leads to different practices regarding the establishment of corporate governance systems and mechanisms. Based on the two conceptualizations presented above (shareholder vs. all parties with a stake), the authors distinguish two polarized perspectives to corporate governance: the shareholder and the stakeholder perspectives. On the one hand, the shareholder perspective claims that the key aim of corporate governance is the protection of shareholder interests by maximizing corporate value. On the other hand, the stakeholder perspective advocates that the main objective of corporate governance is to guarantee the interests of all of the firm’s stakeholders. Under this perspective, corporate governance is concerned with the configuration of relationships among all the constituencies that are directly or indirectly related to companies.

Both perspectives are the most relevant approaches for analyzing corporate governance systems. They rely on distinctive theoretical frameworks to represent the relationships among corporate actors and support the establishment of different mechanisms and measures as a means to achieve the goal of corporate governance (Letza et al. 2004). According to Ball et al. (2000), the shareholder and the stakeholder approaches to corporate governance are embedded in different business cultures of a country. The shareholder corporate governance perspective is related to common-law countries, such as Australia, Canada, United Kingdom, or USA. In these countries, firms are considered as tools to maximize the wealth of shareholders. By contrast, the stakeholder perspective is related to code-law countries, such as France, Germany, or Japan. In these countries, stakeholders are considered to be legitimately entitled to have an interest in firms.

Shareholder Perspective

Under the shareholder perspective, the goal of corporate governance systems is to protect the interests of shareholders and maximize their wealth. According to Letza et al. (2004), this perspective considers corporate governance a

private issue that supports the rights of shareholders as corporate owners and the obligation of the company to meet their interests. Therefore, under this approach, corporate governance comprises instruments and mechanisms seeking to guarantee that managers effectively allocate the resources of the company to increasing profits and consequently maximize shareholder value (Bushman and Smith 2001). This perspective is the classical approach to corporate governance, and it has historically been the one supported by corporate governance codes worldwide.

The shareholder perspective is grounded on classical theories of corporate governance, such as agency, stewardship, and resource dependence theories (John and Senbet 1998; Kiel and Nicholson 2003; Van den Berghe and Levrain 2004). These theories study the corporate governance factors that could affect shareholder value, as the final measure of the success of corporate governance. Shareholders (principals) of most modern companies delegate the day-to-day running of their firm to managers (agents). This situation creates a divide between ownership and control (Berle and Means 1932). In this context, agency theory advocates that agency problems could appear because managers may behave opportunistically to satisfy their own interests at the expense of shareholder value (Jensen and Meckling 1976). A contract should then be established between shareholders and managers. Corporate governance mechanisms should monitor that the former respect the contract. Conversely, stewardship theory suggests that managers are not always naturally inclined to commit opportunistic actions because they could have intrinsic and personal motivations to protect shareholder interests, such as reputation, success, social recognition (Donaldson and Davis 1994). Additionally, managers are expected to possess appropriate knowledge and skills to make the correct decisions in order to enhance shareholder value. Finally, resource dependence theory argues that managers and directors may provide companies with access to the appropriate resources to improve financial performance as a consequence of their contacts, their expertise, and their links with the environment (Pfeffer and Salancik 1978).

Several corporate governance mechanisms contribute to achieving the goal of the shareholder perspective of corporate governance. These mechanisms fall into two categories: internal and external (Fernández and Gómez 1999). The most relevant internal mechanisms are the annual general meeting of shareholders, the board of directors, the incentive system, and the ownership structure. The annual general meeting is the governing body of corporations and represents the rights of all shareholders. The board of directors is responsible of monitoring managers and should provide them with adequate strategic advice. The incentive system should incentivize the alignment of the interests of managers and shareholder by linking the remuneration of the former to the maximization of value for the latter. Finally, the ownership structure could contribute to minimizing agency problems if managers are owners of the company. External mechanisms are also useful in promoting the protection of shareholder interests. The most significant external mechanisms are the legal and regulatory systems, the capital market, and the labor market. The legal and regulatory systems may develop rules and norms that compel managers to behave responsibly. In this regard, it is noteworthy that self-regulation is more common in countries of shareholder corporate governance systems because it has been proved more effective (Letza et al. 2004). The capital markets could also influence managerial behavior. The share price of the firm represents a good assessment for the performance of managers. The threat of takeovers could also have a significant impact on managers. Additionally, the labor market may discipline managers as their wages and possibility of being hired by other companies depend on how they perform.

Stakeholder Perspective

Under the stakeholder perspective, the aim of corporate governance is to guarantee the protection of the interests of all of a company's stakeholders (Letza et al. 2004). This approach contrasts to the shareholder perspective because

it broadens the scope of corporate governance by considering that stakeholder interests are comparable to those of shareholders. In so doing, the firm should try to increase the welfare of all stakeholders and not just of its owners. This perspective emerged in the late twentieth century, when several academics started to advocate that all the constituencies that affect and/or are affected by the activities of a firm have certain rights over it (Freeman 1984). Employees, customers, suppliers, creditors, the environment, and even society as a whole may bear legitimate interests based on the stakeholder perspective of corporate governance. The recent inclusion of recommendation concerning stakeholders in corporate governance codes of some countries shows the change toward a stakeholder conception of corporate governance (Szabó and Sørensen 2013). Further, some definitions of corporate governance explicitly recognize the relevance of stakeholders. For instance, John and Senbet (1998, p. 372) state that “Corporate governance deals with mechanisms by which stakeholders of a corporation exercise control over corporate insiders and management such that their interests are protected.” By emphasizing the importance of stakeholders, this perspective strengthens the interrelated link between corporate governance and corporate social responsibility (Jamali et al. 2008). Corporate social responsibility aims to maximize “. . .the creation of shared value for their owners/shareholders and for their other stakeholders and society at large” (European Commission 2011 p. 6). Therefore, CSR represents a strategy that could help to fulfill the goal of corporate governance under the stakeholder perspective.

The stakeholder perspective is theoretically grounded on Freeman’s (1984) stakeholder theory, which argues that firms should be accountable to and managed for the purpose of the benefit of all stakeholders and not only of shareholders. Therefore, given that there could be different and competing interests among stakeholders, corporations need to properly balance their demands (Sternberg 1997). Following Donaldson and Preston (1995), Letza et al. (2004) identified two streams of the stakeholder theory. The normative stakeholder theory regards the fulfillment of

stakeholder interests as the “end” and emphasizes the significant role of corporations in society. The instrumental stakeholder theory regards the consideration of stakeholder interests as a “means” to legitimate corporate actions and increase corporate value. The latter is particularly related to the most prevalent approach to CSR, the instrumental approach, which considers CSR (and consequently stakeholder management) as a means to increase corporate wealth.

Internal mechanisms are more effective when considering the stakeholder perspective of corporate governance (Letza et al. 2004). Boards of directors play a relevant role in how firms respond to stakeholder interests by fostering corporate social responsibility policies (Khan et al. 2013) as they should provide managers with strategic advice. As a consequence of the growing importance of corporate social responsibility within overall corporate strategies (Porter and Kramer 2006), new corporate governance appeared, such as corporate social responsibility committees and sustainability reporting, with the aim of managing stakeholder interests (Money and Schepers 2007).

Reconciling Both Perspectives

The shareholder and the stakeholder perspectives of corporate governance may be regarded as competing approaches because they represent two polarized and antagonistic positions: satisfying the interests of the rest of the stakeholders could imply that the firm gives less attention to shareholder interests (Letza et al. 2004). This opposing relationship could be even more apparent when considering stakeholder theory in its most extreme and orthodox conception. According to Sternberg (1997), by focusing on the need to balance the interests of all corporate stakeholders, stakeholder theory avoids favoring one constituency over the others, as could be the case of shareholders under the shareholder perspective. She argues that stakeholder theory completely removes the possibility of achieving the objective of the shareholder perspective as it jeopardizes the rights of corporate owners.

Letza et al. (2004) suggest that, although this opposing view could be the most likely to be initially apparent, supporting one perspective does not actually exclude the other. None of them is superior to the other as they are not capable of explaining the reality of corporations individually. They argue that we need to critically reflect on the arguments and key points of each perspective to understand the dynamism that exists between them, as well as the contextual process that characterizes their relationship. Corporate governance systems are continuously evolving and adapting to the values and characteristics of the societies in which they operate. Therefore, one could be more appropriate at particular moment of time, while the other may prove more adequate at a different point of time.

Furthermore, drawing on a less stringent approach of stakeholder theory, both corporate governance perspectives may actually be considered as complementary. The stakeholder perspective considers that the main objective of corporate governance is to guarantee the interests of all of the firm's stakeholders. However, in so doing, it does not advocate the protection of stakeholder interests at the expense of the protection of the shareholder interests. It extends the scope of corporate governance by considering shareholders a specific type of stakeholder, with rights equal to those held by others (Money and Schepers 2007). This approach is grounded on the instrumental stream of stakeholder theory. Given that the fulfillment of stakeholder interests is used as means to protect shareholder interests, it is possible to, at least partly, achieve the goals of both corporate governance perspectives at the same time. This interdependent relationship between the perspectives suggests avenues for future research regarding whether the traditional elements and prescriptions of the shareholder perspective hold or not for the stakeholder perspective (García-Torea et al. 2016).

Definition

The corporate scandals proved the weaknesses of financial reports, and the attention was oriented to other mechanisms to improve corporate accountability and transparency. The corporate governance reporting (CGR), as a nonfinancial report, discloses to stakeholders voluntary information of the corporations' activities and its quality which is based on the corporate board structures and on the practical instruments used for assessing the degree of corporations' responsibility to apply the internal and external regulations.

Introduction

The digitalization and the crisis generated by COVID-19 raise many challenges for corporate governance disclosures. In the light of the pandemic crisis, the stakeholders require much information, not only financial information but also information that proves the sustainability of the corporations in relation to society and the environment.

The diversity of corporate reporting and the challenges such as the pandemic crisis make corporations pay more attention to providing information to stakeholders and shareholders, considering their expectations (Idowu et al. 2017). Moreover, annual reports disclose to stakeholders and shareholders mandatory and/or

voluntary information related to the main activities and responsibilities of the corporations.

The corporate financial report is a complex report that includes financial and other additional nonfinancial information related to corporate accountability. Therefore, in a corporate financial report, we will find information related to corporate governance, corporate social responsibility, risk evaluation, and intrinsic and extrinsic motivation.

As a result of mandatory laws and regulations, the financial report will disclose to stakeholders only the mandatory information. Thus, the corporations for providing their seriousness should disclose voluntary information related to the degree of involvement of corporate board and managers in investor protection and in promoting high transparency.

De Villiers and Dimes (2021), analyzing the triple corporate governance elements as determinants, mechanisms, and consequences, concluded that the information provided by CGR could provide stakeholders and shareholders with an overview of the relationship between internal corporate governance mechanisms and financial performance.

Considering the particularities of corporate governance, the structure of CGR usually contains general financial (i.e., board remuneration) and nonfinancial information related to the particularities of corporate governance in consensus with its mission and vision, the decisional structures of the corporation as the board of managers, the set of committees, the internal and external regulations, and some compensations for managerial staff.

First, the lack or low degree of transparency is a source of managers' reluctance about the amount and quality of information they must voluntarily disclose on CGR. Second, the national legislation and investor protection regulations directly influence the quality of CGR because of the particularities of corporate governance information disclosed.

Schiehl and Martins (2016), analyzing the relationship between effects of country- and firm-level governance mechanisms, concluded

that economic perspective predominantly guided the corporate governance research, and institutional perspective of specific governance mechanisms was not considered as relevant factor analysis in establishing the influence of country-level governance factors on firm-level governance mechanisms. Therefore, the national governance factors should be seriously considered when the stakeholders and shareholders evaluate a CGR.

The Impact of Legislation on Corporate Governance Reporting Quality

The corporations should consider the countries' legislation in which they carry out their activity. The national legislation directly influences the quality of CGR, and in the countries where the legislation has a low degree of dispersal of responsibilities, the information asymmetry is missing from CGR.

The national legislation is completed with social and cultural norms and contributes to the development of corporate social responsibility. Legislation in countries where corporate scandals have caused great harm to society as a whole has imposed strict rules that have been transposed into corporate governance codes, strengthening the role and responsibility of internal control. Therefore, regardless of the degree of internationalization of the corporations, specific articles of their governing code must comply with the country's legislation in which they operate.

However, regardless of the corporate governance code, the national legislation, the CGR is a mechanism that interprets corporate governance according to the availability of managers to disclose information and reduce information asymmetry (Burlea-Schiopoiu and Idowu 2016).

The quality of information disclosed by CGR is challenging to assess by stakeholders because of the lack of legislation (especially national legislation) that does not clearly distinguish between mandatory and voluntary information to disclose by corporations. The CGR, because of the many

reports (financial and/or nonfinancial) that corporations must prepare, become a complacency report with standard forms that provide stakeholders with only technical information without a logical interpretation, comparison, or justification.

The structure of many CGR looks like a puzzle with dispersed pieces and without a logical connection between them, and it is a consequence of the abundant and contradictory legislation and regulations. The dispersal of responsibilities also contributes to disclosing irrelevant information for stakeholders and shareholders (Burlea-Schiopoiu 2019). Therefore, the information scarcity from CGR results from external factors (the national legislation) and internal factors (managers' reluctance about the amount and quality of information they must voluntarily disclose).

Future Directions

Future research should be devoted to analyzing how to transform CGR from a description of corporation mechanisms and internal procedures into a powerful tool that will reduce information dispersion and improve corporate reputation (Burlea-Schiopoiu and Balan 2021). The internal and external communication channels will be evaluated as levers through which voluntary disclosure information will be strongly related to the corporate mission and vision as also Lai et al. (2019) considered. The information asymmetry presented in CGR will require special attention because the corporations should elaborate a transparency disclosure strategy and policy for improving their reputation. In the future, the quality of CGR will no longer be evaluated by its amount of information and complexity but in terms of the ease with which it will transmit the information even to those stakeholders who are not familiar with corporate mechanisms and procedures. Therefore, negative phenomena that influence the quality of CGR will be drastically reduced, and the report will become a relevant source of information for stakeholders and shareholders.

Summary

The CGR is an essential tool that contributes to increasing the corporate reputation by disclosing information requested by stakeholders, mainly by the public. The degree of transparency proved by GCR is strongly related to corporate sustainability and legitimacy and represents its business card. The quality of GCR is assessed in correlation with its reliability and the logical presentation of data by avoiding information asymmetry. Therefore, the companies should use the CGR in their external strategies and as a source of continuously improving the governance mechanisms. The question that should be laid out as a motif of GCR is the following: What information is important to disclose to prove a high degree of transparency and earn a good reputation? The company should answer using the method, out of the box and from the stakeholders' perspective.

Definition/Description

The increased focus on good governance and the development of best practice guidelines, often supported by legislation, has been in response to corporate scandals, such as Enron and WorldCom in the early 2000s and the 2008 banking crisis. Good governance is increasingly recognized as a process where the “best practices” of yesterday

become the standard practices of today. This increased focus has also coincided with a worldwide movement for corporate reporting on sustainability and corporate social responsibility (CSR) issues and a growing demand within the investment industry for investment products that are socially responsible (Benn and Dunphy 2013). Sustainable development is now part of the best practice model of corporate governance. There is a more equal recognition of stakeholders' interests and the role of not only economic but also social and environmental issues in laying the foundations for a new long-term model of economic growth. This is in contrast to the historic governing model that focused on the creation of shareholder value. However, despite increased attention and interest by policymakers and academics alike, a challenge that has not been unanimously resolved is the definition and measurement of “good corporate governance.” This chapter evaluates the main approaches to the measurement of corporate governance.

Why Measure Quality Corporate Governance

There is a view by some policymakers and academics that there is a positive association between the quality of corporate governance and corporate performance. A measure of corporate governance is required to test this proposition. Considerable attention has been directed at measuring best governance practice in academic literature. This information is then used to examine the link between corporate governance and corporate performance. Corporate performance is typically measured using profits, dividends, or share price increases. However, the findings are not unanimous – some studies have identified a link (MacAvoy and Millstein 2003); however, most show “mixed results without a clear-cut relationship” (Crowther and Aras 2016, p. 14). Tangential evidence from corporations suggest that they also believe there to be benefits from good corporate governance as many implemented voluntary changes to their corporate governance in the aftermath of the financial crisis. These steps could reflect a signal

by governing boards to regulators, the market, and the general public that they appreciate the social impact of weak governance (Carretta et al. 2010).

Indicators of Quality Corporate Governance

There are two main considerations regarding measuring governance quality: first identifying measures of governance, and second the variables employed as proxies for the measures identified.

Sources of information on good corporate governance: Governance requirements arise from four sources: (1) the requirements of the individual corporation's founding documents and other contractual documents, (2) corporate law within the operational jurisdiction, (3) relevant corporate codes of conduct, and (4) the requirements of regulators. These four sources are not separate and distinct as each influence, and have been influenced by the other, through the cultural, political, social, and historical circumstances of each country in which the corporate operates. For example, following the global financial crisis and banking failures in 2008, many jurisdictions introduced new laws and regulations to strengthen corporate governance. These changes were a direct response to a cultural change in the political and public perceptions of the role and impact of regulators and corporations on wider society and taxpayers.

Measures of good corporate governance: Researchers and regulators have attempted to identify "best practice" measures. Many of these measures are included in corporate law or in corporate governance codes. Examples of measurable variables that could be included in an index include CEO duality, proportion of nonexecutive directors, having a remuneration committee, a nominations committee, a risk committee, an audit committee, etc. Indeed, it would be expected that recommendations under corporate governance codes and corporate law would be included as a minimum. Examples of the criteria used by two of the main index providers are now outlined in brief. Most indices identify a number of measurable indicators of good corporate governance

and classify them into different areas. These areas typically center on board structure, equity structure, compensation, audit, and ownership (FTSE Research 2005). For example, Institutional Shareholder Services (ISS) collects information and analyzes it into four components of good corporate governance. Component one evaluates "board structure." This component includes information on board composition, composition of committees, board practices, board policy, and diversity. Component two evaluates "compensation programs." This component includes information on pay for performance, communications and disclosures, nonexecutive pay, and termination. Component three evaluates "shareholder rights." This component includes information on takeover defenses, shareholder meetings and voting rights, and procedures. Finally, component four evaluates "audit and risk oversight" (ISS 2019b). This component includes information on the external auditor, the audit, and accounting issues. Research has found a relationship between many of these measures, for example, board size, board composition (the fraction of independent directors), and director ownership (proportion of shares owned collectively by all directors) and board effectiveness (Faleye et al. 2011).

Limitations of Indices of Quality Corporate Governance

A variety of corporate governance indices are used to assess the quality of corporate governance. The indices are not homogenous; there are similarities but also differences in the underlying variables used to measure quality corporate governance. Most indices assume a "one-shoe-size-fits-all" approach that there is an optimal governance structure and any deviation from this reflects a governance problem. Yet most of these governance indices are based on structural measures that are easily measured. The problem lies in what they are not capturing. Research has identified a number of issues with current measures of quality corporate governance and empirical studies that examine the link between corporate governance, using these rating measures, and

performance. The problems identified include lack of inclusion of nonfinancial measures, omitted variables, use of a bundled index approach, endogeneity, and board dynamics. These are now discussed in turn.

Nonfinancial indicators: An underlying assumption of many academic studies is that corporates pursue financial outcomes as their primary objective and shareholders are the primary stakeholder. This approach does not consider performance in terms of the impact the corporate has on society and the environment. It is argued that this narrow approach is no longer valid given the increasing focus on the wider impact of weak corporate governance, particularly following the financial crisis of 2008, on society, communities, and taxpayers (Willems et al. 2012). Nonprofit research has attempted to address this, as financial outcomes are only one measure of nonprofit success; however, identifying a method to assess and compare corporate performance is more difficult, and there is no agreed measure or composite of measures of corporate performance (Newton 2015).

Omitted variables: Research has identified that some characteristics that are not included in indices contribute to effective governance, such as the quality of board meeting discussions (Wan and Ong 2005), and the indices often fail to account for the impact of the external context, for example, country, legal system, corporate factors, and industry. It is argued that optimal governance may vary across corporations and industry types that there is no “one-size-fits-all” model (Vagliasindi 2008) and though different industries or countries can learn from each other’s governance approaches they cannot simply apply an external governance model to their own industry or country (Petrovic 2008).

Criticism of a bundled approach: Indices are typically constructed from a wide range of indicators of corporate governance. They are criticized for using too many variables rather than focusing on the variables that “really matter,” a “kitchen-sink approach” (Bebchuk et al. 2009). They are criticized on the appropriateness of the selected variables and the weighting attached to each variable. Existing ratings either arbitrarily sum up several indicators into a single measure (Daines et al. 2010) or employ sophisticated but

completely opaque algorithms. Finally, it is argued that indices frequently fail to demonstrate the theoretical justification of the composition of indicators and the weighting of different variables (Schnyder 2012). Despite the weaknesses and criticisms of governance indices, it is argued that reducing the measures included in them is a step in the wrong direction, as it eliminates information about interactions between different corporate governance mechanisms. As Schnyder (2012) concludes, things should be kept as simple as possible, but not simpler.

Endogeneity and board dynamics: Even where a positive link is found between a governance measure and corporate value or performance, the research approach faces a series of criticisms. First is the consensus view that the relationship between governance and corporate performance is endogenous, simply put, there could be an error in the direction of causality, and all variables in governance are endogenous (Vagliasindi 2008). Second, there is often a lack of clarity on the level of analysis, for example, it may not be clear if the variable included is an individual director or the board as a group (Petrovic 2008). Moreover, board dynamics analysis can fail to consider the structural and contextual elements impacting governance and the interplay between these factors (Petrovic 2008).

These issues impact the validity and reliability of governance indices. They make definite “best practice” claims difficult and may explain some of the contradictory findings in the research with consequent challenges for governance indices (Bebchuk et al. 2013; Dumitrescu and Zakriya 2019). For example, it has proven difficult to show that even sophisticated professional measures of the quality of a corporate’s corporate governance system produced by different commercial providers are able to predict future performance (Schnyder 2012). In addition, corporate governance indices are subject to further criticism in respect of the data collection process.

Data Collection

A review of the literature identifies three main approaches to gathering data on governance

quality: benchmarking disclosures against an index of disclosures that are deemed to reflect governance quality, surveying individuals within the corporation, and measuring the volume of voluntary public disclosures. These are now critiqued in turn.

Benchmarking corporate disclosures to a corporate governance index: Indices to assess governance quality are created by researchers and professional organizations based on the criteria prescribed by legal and cultural, and recommended requirements established by policymaking bodies set up to promote good corporate governance, such as the UK Corporate Governance Code published by the Financial Reporting Council in the United Kingdom. The criteria are used to form a checklist of “ideal” corporate governance practices. Data is collected by benchmarking the information on corporate governance disclosed in corporations’ annual reports and/or website to the checklist. Coding usually involves awarding a score of one when the measure of quality governance is present and zero if there is no evidence of it. A cumulative score is determined for each corporation. This may be expressed in percentage terms. The higher the percentage, the higher the quality of corporate governance. The final percentage forms the index. The indices make it easier for investors to assess the quality of corporate governance as the resultant score is used to rate corporations relative to each other and over time. The score can also highlight the degree of risk an investor takes when he/she invests in a corporation. There is demand for this form of data collection, and several consultancy firms specialize in producing governance indices and collecting data based on these indices for investors. For example, ISS is the largest provider of information on governance to hedge funds, mutual funds, and similar organizations and provides Governance Quality Scores to its clients. These clients managed investments worth about \$4.2 trillion in 2019 (ISS 2019a). Corporate governance ratings also serve as inputs into tradable indices (Daines et al. 2010) such as those created by FTSE Group and Standard & Poor’s. Some of the more widely employed indices include MSCI ESG Metrics, ISS’s

Governance Quality Score, Sustainalytics ESG Risk Ratings, Standard & Poor’s Trucost ESG Analysis, Dow Jones Sustainability Index, and Business in the Community Corporate Responsibility Index. Indices highlight the importance of quality corporate governance and, through publicizing it, put pressure on corporates to conform.

Survey approach: A second approach to calculating data on governance quality is to survey individuals within the corporation. Surveys can either be sent to a single person or to multiple persons within the corporate. These surveys are usually addressed to the CEO or chair of the board, if a single survey is required, or to all board members, if a multiple survey approach is adopted. Examples of this method include the Carver Model and the Governing Board Effectiveness Model, where board effectiveness is assessed by analyzing the responses of board members to a survey (Carver 1997; Gabris and Nelson 2013). This approach encounters the obvious subjective and unique view of an individual respondent or difficulties in assessing a variety of respondents’ perceptions, which can vary widely between individuals (Willems et al. 2012). Researchers attempting this approach also face the trade-offs between multiple raters within a single corporate and a small sample of participant corporations or the unique views of single raters and a larger sample of corporations, with consequences for the validity and reliability of the results (Willems et al. 2012). These elements are thus costly and difficult, if not impossible, for individual investors, stakeholders, or regulators to assess as boards are not required to apply a universal measure of board performance assessment or publish the results of assessments under law or governance codes (Financial Reporting Council 2018).

Volume of voluntary disclosures: Finally, the level of voluntary disclosures by a corporation has been used as a measure of corporate governance quality (Brennan and Solomon 2008). The assumption is that the greater the volume of additional voluntary material provided on corporate governance, the greater the quality of corporate governance within the corporation. However, a focus on word count does not capture the

relevance of the information. In addition, over-disclosure in one area may compensate for omitted disclosures in other areas.

In summary, there are three main approaches to collecting data on governance quality: first measuring public disclosures against set governance criteria outlined in the relevant governance codes; second measuring organization governance through surveys; and finally measuring voluntary public disclosures, to create indices of governance quality.

Summary

Current measures are sourced from governance codes of practice, legislation, and regulations. These policy documents include recommendations and guidance for corporates and boards based on the literature and industry inputs and provide a practical starting point for assessing governance and developing governance indices (Financial Reporting Council 2018). However, it could be argued that corporate governance requires more than compliance with sets of principles or codes of practice, which are often the lowest common denominator for governance standards. Good governance is about human behavior and the role of corporates in society, how corporates are run, and how they relate to their principal stakeholders. Good corporate governance is about compliance in spirit with meaningful quality reporting and transparency for all stakeholders. However, measurement of governance faces considerable challenges including lack of inclusion of nonfinancial indicators, omitted variables, use of a bundled approach, endogeneity, and the relevance of board dynamics. In addition, questions are raised about the appropriateness of some of the data collection techniques. Despite these difficulties and questions about the association between corporate governance and financial performance (Vagliasindi 2008), it is reasonable to conclude that corporate governance matters to a corporate's performance, market valuation, and credibility. Corporate governance is seen as a tool to support the achievement of a corporate's goals and strategy, and investors are willing to pay a premium for well-governed corporates. Therefore, the quest to identify and

measure good corporate governance is ongoing and is likely to attract attention from academics and index providers alike.

The advances in corporate governance measurement to date have had a positive impact on corporate governance. The growth of an industry that supplies corporate governance indices is generating a demand for better measures of quality corporate governance. Despite criticisms of corporate governance indices, indices do provide a benchmark that enable changes in corporate governance over time to be monitored. It can be argued that the use of published indices has also impacted on the quality of corporate governance, that peer pressure has contributed to corporations seeking to improve their standing within these indices, and that this has resulted in a bunching at the top that diminishes the differences between corporations and reflects increasing compliance with good practice.

Definition

When the catastrophic fire at Grenfell Tower in London in June 2017 claimed 72 lives and injured

another 70, it was termed corporate manslaughter by MP David Lammy (Hughes 2017).

Corporate manslaughter is a criminal offence committed by corporations, companies, or organizations. It is an act of homicide, i.e., (un)intentional harmful accidental, negligent, or reckless acts that lead to death(s). Only a few countries, however, have some kind of law to punish the offenders.

Some Dramatic Examples in History

There are many examples in corporate history where companies have been responsible for causing deaths of individual(s). Some of the more famous corporate manslaughter cases from around the world are:

UK

- Herald of Free Enterprise, a ferry which capsized in 1987 killing 193 people dead (Murray and Thimman 2016).
- Clapham Rail crash, where three trains collided in 1988 killing 35 people (Hidden 1989).
- British Petroleum in 2013 pleaded guilty to 11 counts of felony manslaughter in connection with Deepwater Horizon Rig explosion in 2010 (Department of Justice 2012).

Australia

- CSR and James Hardie, two asbestos companies who knowingly withheld the fatal nature of exposure to asbestos from 1000s of their miners (Blunden 2012).
- Esso Longford gas plant explosion in 1998 where two people died (Gooch 2002).

New Zealand

- Pike River Mine disaster, 2010, 29 people died in the mine explosions caused by methane gas (Macfie 2013).

India

- Union Carbide Limited, Bhopal, in 1984, a gas tank leak from a pesticide company which

killed 2500 and injured over 50,000 people (Dubey and Khandekar 1984).

Canada

- Westray mine explosion in 1992 where 26 miners died (Shaun 1993).

Statistics on Corporate Manslaughter

Reiman in his book “The Rich Get Richer and the Poor Get Prison” estimates that in 1972, the number of people in the USA dying from occupational hazards (diseases and accidents) was 114,000, whereas only 20,600 died as victims of personal homicide. Represented on a time clock for murder, there would be 1 personal killing every 26 min but: “ If a similar clock for industrial deaths were constructed...and recalling that this clock ticks only for that half of the population that is the labour force - this clock would show an industrial death about every four and a half minutes! In other words, in the time it takes for one murder on the time clock, six workers have died just trying to make a living!” (Reiman 1979, p. 26).

In a study conducted by Slapper (1993), he states that since 1965, in the UK, 18,151 people have been killed at work without a single company having been convicted for homicide.

The problem is how does one hold a company accountable? There have been laws in the past, but given the complicated nature of businesses and companies, culpability of the companies has always been difficult to establish or prove.

Early Legal Framework

In the UK, which is considered to be a pioneer in this context, the fundamental doctrine of identification, based on attribution, originated in 1940s. It established that a corporation is an “abstraction” and “its active and directing will must be sought in a person who is the very ego and center of its personality which is an agent or the board of directors” (Molan et al. 1996). According to Sullivan (2009), this doctrine implies that the actions

of senior responsible person(s) in charge of the company can be considered to be actions of the company itself making the company responsible for such actions. This makes the company directly culpable and holds it accountable. In other words, it is imperative to identify within the company, individuals who have a direct involvement with the homicide. Such individuals had to have a controlling authority within the corporation.

However, there have been very few convictions since. The reason is, while it might be easy to show gross negligence of individual(s) in smaller companies (see, for example, Lyme Bay disaster), it is very difficult to identify individual(s) in large complex corporations as the controlling mind(s). For example, prosecution charges were dropped in the cases of Kings Cross Fire in 1987 which killed 31 people, the Piper Alpha Oil Platform disaster in 1988 where 167 people died and the sinking of the Marchioness in 1989 where 51 people died. The reason being there was insufficient evidence to establish culpability on part of relatively senior controlling authority. In case of the Ladbroke Grove rail crash (also referred to as Paddington Rail crash) that occurred in October 1999, the Crown Prosecution Services decided not to bring manslaughter charges against any individuals or companies leading to a public outcry and inquiry.

Following this public inquiry, the corporations were successfully convicted on health and safety legislation and had to pay hefty fines. In April 2004, Thames Trains was fined a record £2 million after admitting violations of health and safety law in connection with the accident and ordered to pay £75,000 in legal costs ("Thames Trains fined," 2004). Bob Crow, general secretary of the rail workers' union, the RMT, said: "No amount of money can bring back those who lost their lives... We need a proper corporate manslaughter law so that bosses responsible for causing unnecessary deaths are put behind bars where they belong" ("Thames Trains fined," 2004). In the same context, Network Rail was fined £4 million in March 2007 and ordered to pay £225,000 in legal costs ("Paddington crash" 2007).

However, yet again, no single individual was identified and held responsible for the manslaughter based on the doctrine of identification.

Companies have the power to destroy lives and livelihoods as evidenced by, for instance, the BP oil spill case, and there is now a growing discussion of the idea that a company can and should be held to account for its criminal behavior or gross negligence.

Current Legal Developments

Following all the tragic corporate accidents, there was an urgent demand to fix the existing law. The Corporate Manslaughter and Corporate Homicide Act 2007 came into force in the UK becoming a law in 2008 (Roper 2018). This law threatens with tougher penalties to strengthen health and safety standards. A corporate manslaughter conviction now carries the threat of an unlimited fine, as well as so-called "publicity order," requiring every offender to effectively advertise its own conviction (Murphy and Peel 2009).

According to Price (2018), the Corporate Manslaughter and Corporate Homicide Act 2007 aims to move away for the identification doctrine which requires senior responsible individual(s) to be identified as the company themselves, and more towards an organizational model of corporate liability. He argues that inherent in large companies are structures or authoritative systems that emerge over time driven by the involvement of senior managers. These structures or systems form the employees' perception of the boundaries and direction of their work. He states that organizations impose such authoritative systems on their employees and as such establish a direct link between the organization and corporate culpability. This in turn makes the company responsible for its irresponsibility.

Corporate Manslaughter around the World

Corporate manslaughter is now a crime in several jurisdictions, including England and Wales and

Hong Kong (Jackson 2003). It enables a corporation to be punished and censured for culpable conduct that leads to a person's death. This extends beyond any compensation that might be awarded in civil litigation or any criminal prosecution of an individual (including an employee or contractor) (Jackson 2003).

In the USA, currently there is no corporate manslaughter law though there have been calls for corporate death penalty (Markoff 2012–13). The USA does have an Occupational Safety and Health Administration (OSHA) which imposes civil fines on companies for worker deaths (Mokhiber 2013).

In case of the USA, it is interesting to note that while Enron is considered to a textbook case of corporate misbehavior and fraud, majority of the charges brought against the company and its top bosses dealt with financial fraud and not corporate homicide. A pertinent question would be to ask whether Enron and its actions were responsible directly for at least one death – that of Richard Baxter.

New Zealand, Canada, and Australia all have some version of the corporate manslaughter law. In most of the rest of the world, laws to take a company to task for its criminal actions are almost nonexistent.

Corporate Manslaughter in the Context of Governance

It is now well accepted that the narrow focus of companies on shareholders rather than stakeholders is responsible for the short termism in company's decision-making process. This leads to making decisions which add to the shareholder wealth with little or no regard to stakeholder well-being. Classic cost-benefit analysis is done by companies to make sure that shareholders are happy while stakeholders pay the immediate price. Ed Freeman has long been advocating stakeholder theory as a way for more responsible corporate behavior (Freeman 1984). Despite this, disastrous accidents happen due to corporations having an arms-length cost-benefit analysis policy with health and safety measures.

Corporate manslaughter is a crime that is complicated to prove and indict especially in today's increasingly complicated multinational structures. It makes it even more pertinent to have accountability in such case and to have a law in place that allows requisite redressal of valid cases. Severe fines, penalties, and individual sanctions would serve as a deterrent in the future to companies tempted to put profits before people.

Definition

Since the 1980s and beyond, when the understanding of the Total Quality Management approach as an important management system for organizations, vision and mission for organizations has started to gain importance, and today it enables organizations to exhibit their differences as an important strategic tool. Due to the change and development that organizations face over time, changes have been observed in the content of vision, mission, and value concepts. Factors that increase competition such as changing environmental conditions, customer expectations, increasing awareness of conscious production and consumption, rapidly changing technology, and the emergence of new markets have made it necessary for organizations to consider sustainability as a part of their strategy in their vision, mission, and values.

Mission is a clear, unambiguous statement of an organization's reason for existence. Vision, on the other hand, is the point where the organization reveals its future purpose, works on, and wants to reach. It has a feature that contributes both to the present and to the future. Values are the ideals and principles that guide the thoughts and behaviors of an organization and define the culture of the organization. The harmony of mission, vision, and values will ensure the most appropriate use of the organization's resources, and it will coordinate the organization by shaping decisions and activities as an important guiding force.

Corporate Mission

Drucker (1974) defines mission as an existence of organization. It is a concept that emerged while searching for an answer to “What is our job?” which helps to determine the reason why organizations exist. The purpose of the organizational mission is to combine the various elements within the organization within the framework of a common purpose, to give the organization a strategic direction and to ensure that the resources are used in this direction. The mission describes the organization's reason for existence. As the mission

Corporate Mission, Vision, and Values

Synonyms

Core values; Organizational goals; Organizational objectives; Organization's reason for existence

presents a leading feature in terms of corporate strategy, it might be assumed that it stands at the beginning of corporate strategy. From this view, in the strategy formulation process, and while choosing the most suitable one among the various alternatives encountered, the purpose of why the organization exists declared in the mission statement guides the corporate strategy (Ülgen and Mirze 2007).

Having a clear mission statement helps all members and managers discover and realize the purpose and reason for existence of the firm, so that internal and external factors can be prioritized while determining which resources to use when determining the strategies to be implemented. On the other hand, one of the most obvious benefits is that it provides a base and a framework for organizing businesses, departments, activities, and divisions around a common aim.

Clearly stated mission expected to have the following characteristics:

- It should reflect a goal that organizations want to achieve in the long run.
- It should include common and shared beliefs and values of the organization.
- It should encompass the entire organization as employees, organizations, suppliers, and customers.

Several studies that focus on the features of an effective mission statement – which is an important strategic management tool – indicate that a mission statement should contain nine components, including customers, products or services, markets, technology, concern for survival, growth and profitability, philosophy, self-concept, concern for public image, and concern for employees (David et al. 2014; Bart and Baetz 1996; O’Gorman and Doran 1999; Pearce II and David 1987).

Corporate Vision

Vision plays a very important role in achieving organizational goals and it is an opinion about the

future of the organization (Denison 2007). Corporate vision touches both the heart and the brain of the organization and clarifies values. Vision is a combination of the organization’s mission, goals, objectives, and values (Ülgen and Mirze 2007), and it is one of the most important strategic management tools.

Vision expresses common goals and beliefs so that it can be interpreted as a shared image of the future; at the same, time it is a statement that helps to develop strategies on the axis of core values and goals. Having a vision is critical in today’s competitive environment, organizations’ ability to cope with the changing world and to be successful in a global competitive environment requires change. The prerequisite for this change and development will be possible with the creation of a shared vision.

A shared vision creates a link between employees and the goals of the organization and gives motivation. In addition, creating a shared vision brings convenience to the organization in terms of making and implementing decisions. As the organizational structure becomes broader and more horizontal, decisions are increasingly made in decentralized units. In these circumstances, a clear vision acts as a compass.

Clearly stated vision is expected to have the following characteristics:

- It should be memorable, remarkable, and inspirational.
- It should be idealistic and original.
- It should increase the organizational commitment.

Corporate Values

In the lexical meaning, the concept of value is the importance of objects and events for a society, an individual, or a community, the purpose that can be symbolic or material, and abstract and common measures. Values are the beliefs and moral principles behind organizational culture. Values, which are a kind of set of rules, are a set of guiding rules that compel its members to show consistent behaviors in order for the organization to survive,

develop, and progress within certain limits. It defines how the organization does its job, what kind of behavior is in compliance with the rules in this process, how employees should behave, and what methods are acceptable in behavior and decision-making processes.

Values express the essential and permanent principles (Collins and Porras 1991) and management style of the organization. The most important function of the values is to guide behavior in various situations and conditions and to set specific standards to the individual (Hodkinson 1996). Considered from this perspective, organizations need to harmonize individual and organizational values in order to benefit from the values in the best way (Posner and Schmidt 1992). The underlying reason for this is that individual values guide the individual's own goals and behaviors while organizational values guide organizational goals, policies, and strategies in a broader framework (Wiener 1988).

The Role of Mission, Vision, and Corporate Values on Organizational Effectiveness

In the area of organizational studies, several researchers have focused on the strategic importance of the mission and vision statements in regard to organizational effectiveness. Successful organizations have an apparent perception of intention and direction that allows them to follow organizational aims and strategic purposes and presents a vision of how the organization will be seen in the long term (Hamel and Prahalad 1994; Mintzberg 1987, 1994). Organizations' underlying mission provides a meaning, purpose, and noneconomical effects at first sight and leads the members of the organization to behave compatible in a common mindset (Denison and Mishra 1995).

Regardless of the establishment purpose, the most important way for organizations to continue their existence is to find values suitable for them and to transfer them to their employees with the mission and vision developed in accordance with these values.

Summary

Mission is a clear statement of an organization's reason for existence. Vision, on the other hand, is the point on which the organization puts forward its future purpose and on which it works and wants to reach during its activities. The most important feature of the vision is that it contributes to both the present and the future of the organization. Values are the expression of the ideals and principles that define the culture of the organization. Ideals and principles are very important in terms of having the feature of directing the thoughts and behaviors of an organization. The harmony of mission, vision, and values will ensure the most appropriate use of organizational resources and will coordinate the organization by shaping decisions and activities. Therefore, in terms of organizational effectiveness, mission, vision, and values have strategic importance for the organization.

Corporate Objectives

[Corporate purpose](#)

Introduction and Description

The corporate objective is concerning in whose interests should a company be run. As any rational activity, a company also requires an objective to justify its behavior (Jensen and Meckling 1976), and meanwhile its performance can only be measured and evaluated after establishing such criteria. If no goals or expectations exist, it would be impossible to judge the performance of a company and to evaluate how well the jobs have been done by its directors and managers.

Moreover, the key to how obligations/responsibilities should be allocated for the best corporate governance greatly depends on such ultimate objective. If, for example, the ultimate corporate objective is for all stakeholder groups’ welfare, then a good corporate governance structure should underline their interests, and board directors should run the company for all stakeholders. Accordingly, corporate performance should no longer be solely determined by the share price and the like. In contrast, if shareholder wealth maximization is the corporate objective – i.e., shareholder interests are the primary concern of companies – the focal point would then turn to understanding their role and protecting their interests, which represents the best corporate performance under this approach. In this context, directors should run the company for shareholder wealth maximization, and the basic issue in corporate governance becomes whether shareholder interests can be effectively protected and maximized. Consequently, it is of vital importance to clarify the ultimate objective of the company, especially those large public ones, in order to solve corporate governance improvement issues, determine the extent to which companies should be directed, and managed and provide guidance to directors.

Importance

The corporate objective is arguably one of “the most important theoretical and practical issues confronting us today” because we need it to explain and guide corporate behavior (Walsh 2004). In the words of Professor Henry Hu (1997, p. 380), “the core objectives animate or should animate every decision a corporation makes.” Different objectives can lead to different diagnoses and solutions to corporate governance problems (Letza et al. 2004). It is also argued that “at the heart of the current global corporate governance debate is a remarkable division of opinion about the fundamental purpose of the corporation” (Jensen 2001). And the answer to this issue becomes increasingly important as the business companies’ influential impact on both individuals

and societies (Colombo 2008). If directors run a company in the wrong direction, harder efforts may produce worse results. Put simply, a governance theory cannot begin without a purpose (Carver 2010). Unfortunately, company law in most jurisdictions fails to set forth a corporate objective (Keay 2011). Though in theory members of companies are able to determine the corporate purpose by including it into corporate constitutions, few demand mandatory shareholder primacy. The vast majority of companies' articles do not include a corporate purpose.

Moreover, today's large public companies can hardly be seen as entirely private concerns, further complicating the issue. Companies, especially large public ones, are no longer private organizations – they have the ability to exercise social decision-making power (Parkinson 1993). In Professor Parkinson's words, "companies are able to make choices which have important social consequences: they make private decisions which have public results" (Parkinson 1993, p. 22). More concretely, Mary Stokes (1994, p. 107) points out that "[T]he company has become an organization whose significance almost rivals that of the state. It is the primary institution for organizing and employing much of our capital and labour resources and the primary supplier of goods and services in our community." Thus, as corporate behavior is limited by political, social, and economic environments, the extent to which members can determine purposes of their company is not unrestricted.

Variation

Admittedly, during the preliminary stage of a newly established company, it is usually those entrepreneurial shareholders who take the initiative to seek and recruit essential resources to run the start-up. While other corporate participants also play an important role and contribute indispensable investment, shareholders perform a no less significant role at this stage. Shareholders' contribution is crucial when a new company desperately needs initial monetary capital to purchase machines, raw materials and invest in business

projects, which is often the case for a start-up. More importantly, it is not uncommon for a start-up company to have overlapping management and shareholder bodies. Although other corporate participants like employees and suppliers afford equally or more valuable support to the success of the company and thereby should not be subordinated, due to such overlap, shareholders who maintain control (or directly manage the company) normally have a larger role to play at this stage.

However, alongside corporate growth, the contribution and role of shareholders become gradually less important, though it is difficult to mark exactly at which point. On the one hand, the company is no longer heavily dependent on equity capital to finance new business projects and corporate expansion. A mature company relies more on accumulated corporate profits with years of operation and debt funds. On the other hand, the classical separation of ownership from control is almost inexorable along with the expansion of the company. Widely dispersed shareholders can become rationally apathetic. Especially after adopting strategies of diversified and balanced portfolios, shareholders or institutional investors are less concerned about the success of any particular company than their overall portfolio. The interests of diversified shareholders can be different from those of the company. Furthermore, it is sometimes possible for a shareholder to wish one of her investee companies to fail in order to obtain higher aggregated proceeds from the portfolio. Due to the decoupling of interests from shares by borrowing shares or other modern financial arrangements, certain shareholders' personal interests, particularly certain types of funds, may run completely counter to the interests of a given company. Consequently, "[t]he old language of property and ownership no longer serves us in the modern world because it no longer describes what a company really is" (Handy 1997, pp. 26–27). It would also be too narrowly to define the property only as financial assets, human capitals, and alike provided by stakeholders should also be counted (Handy 1997).

On the contrary, other corporate participants continue to provide significant resources and

actively participate in corporate activities in pursuit of success. Unlike shareholders, who are able to mitigate risks through diversification, most other corporate participants such as employees cannot do so. Consequently, shareholders may not be particularly concerned about the success of a given company, while the welfare of other corporate participants is still closely tied to the very company they have contributed and invested in. As a result, for large public companies which are of course mature enough, there are few grounds for the shareholders to determine the corporate objective. Indeed, when a company transitions into a “mature” stage, it is questionable that the original founder’s objective, if any, remains unchanged.

The Debate

The corporate objective is not a new issue – the debate has been continuing for years. Berle (1932) and Dodd’s (1932) 80-year-old debate about corporate purpose continues today: Is the sole aim of companies to create benefits for shareholders at all times, or should broader concerns be taken into account? In the beginning, Berle asserted that all powers granted to corporation and management alike should always be exercised for the interests of shareholders as sole beneficiaries. But not long afterwards, Dodd (1932) questioned Berle’s doctrine of corporate power in trust, arguing that a company should perhaps consider the interests of people other than the owners, particularly in the public utility field. Berle (1932) responded that if the company is run not just for the shareholders’ interest, then in practice managerial power could not be effectively controlled, or, worse, the power of unchecked management might become absolute. However, it is not difficult to see that in his seminal work *The Modern Corporation and Private Property* (Berle and Means 1991, originally published 1932), co-authored with Gardiner Means, corporate power serves more than just the shareholders’ interest; it might also be regarded as in trust for society as a whole to a certain extent, as the so-called owners have surrendered their control and responsibility over the

corporation and corporate property. As a social institution, in the authors’ view, large modern corporations should at least in theory consider other corporate participants’ interests rather than solely the shareholders’ interests.

The source of confusion here is that Berle’s trust theory, which facilitates the development of fiduciary duties, is one of the most powerful weapons for the shareholder primacy approach. But in concluding *The Modern Corporation and Private Property*, Berle opened the question by suggesting that the corporation might have a broader responsibility to the wider community. In fact, Berle does not totally disagree with Dodd’s view. His main concern is that if managers are not solely accountable to stockholders, their discretionary power may become absolute in practice, because no alternative and reasonably enforceable mechanism exists for them to be accountable to multiple or other constituents (e.g., employees, customers, or community) as well.

Summary

Over time, two opposing academic schools have emerged: one is the shareholder model (i.e., shareholder wealth maximization approach), which argues that the primary goal of commercial companies is to maximize shareholder wealth, and the stakeholder model, which argues that the interests of non-shareholding stakeholder groups should not be subordinated to those of shareholders; otherwise society as a whole would suffer.

Definition

Corporate philanthropy is one of the oldest forms of CSR (Mescon and Tilson 1987). Corporate philanthropy is the CSR activity when the company provides financial or in-kind donations and support to a nonprofit organization. The focus is on direct contribution. Philanthropy is the voluntary and unconditional transfer of cash or another asset from a private company for community purposes (FASB 1993).

Corporate philanthropy refers to a one-way relationship, donation to beneficiaries (Fry et al. 1982). Others assume a two-way relationship and also link sponsorship to this concept (Saiia et al. 2003). Synonymous with corporate philanthropy is most often used the concept of donation and charity, of which there are many forms of realization. Merz et al. (2010) also interpret the scope of corporate philanthropy more broadly, including financial support for social and charitable causes, employee volunteering, and donations of material or service (Merz et al. 2010). According to Katamba (2011), philanthropic activities implemented on an ad hoc basis are mostly in the form of financial or in-kind donations.

Gautier and Pache (2015) classify the concept of corporate philanthropy into three groups. The first group includes approaches to the voluntary expression of a commitment to the common good. The second group is the treatment of the activity as a long-term, community-oriented investment. The third is a marketing approach. This grouping is also followed by the identification of charity, community investment, and trade categories (CECP 2012).

Corporate Philanthropy

Introduction

Corporate philanthropy (CP) is the most common and traditional way of corporate social responsibility (CSR). In many cases, it is only realized on an ad hoc basis, but strategic philanthropy is increasingly emerging by linking to company goals. Increasingly, companies are also looking to build long-term relationships in the case of philanthropy. In addition to donations, product

input, use of distribution channels, use of technical expertise, employee involvement, measurability, and traceability appear. Social media gives companies the opportunity to involve consumers in deciding which NGOs the company should support.

Kotler and Lee (2005) distinguish six social initiatives within CSR, three market driven: cause promotion, cause-related marketing, corporate social marketing, and three company driven: corporate philanthropy, workforce volunteering, socially responsible business practices, i.e., based on a CSR marketing approach, corporate philanthropy is one form of implementation of CSR.

Rangan et al. (2015) categorized CSR activities into three groups: He calls philanthropy actions that the company does not directly benefit from. It identifies activities that increase efficiency and effectiveness as an activity for better functioning. It also classifies activities related to the transformation of a company as a result of environmental or social problems (Rangan et al. 2015 in Manuel and Herron 2020). While based on this categorization, philanthropy is an activity interpreted broadly, a number of definitions help to define it more precisely. Williams (2003) also interprets philanthropy as part of CSR.

Carroll (1991) claimed that the highest level of the corporate CSR pyramid is philanthropic activity. It serves the expectations of society, where companies must behave as good corporate citizens. This may include the promotion of human well-being and goodwill and related programs. However, he also notes that philanthropy is only desirable after the other three levels, i.e., companies should be responsible economically, legally, and ethically first, followed by philanthropic behavior.

Types of Corporate Philanthropy

Corporate philanthropy can typically be implemented in three ways: corporate donation, corporate volunteering, and corporate foundations (Melé 2008; Gautier and Pache 2015).

Anheier and Leat (2006) distinguish three feasibility options for corporate philanthropy. There

is traditional charity that builds on support, typically in the immediate local setting, with the disadvantage that it is only good for symptomatic treatment but does not solve the root of the social problem itself. The aim of scientific philanthropy is to combat social problems through knowledge generation and charitable research. The new scientific approach focuses on the impact of corporate philanthropy, that is, the use of science to solve social issues, in which common value creation is realized by combining business and social goals. Schnurbein et al. (2016) complements this categorization with the concept of exclusive corporate philanthropy, the essence of which is that in philanthropy there is still opportunity for free choice, while other areas of CSR are increasingly deregulated, i.e., innovation and pluralism can prevail here.

The following possibilities of philanthropy can be distinguished (Kotler and Lee 2005):

- Monetary donation
- Offering grants
- Scholarships
- Donating products
- Donating services
- Providing technical expertise
- Ensuring the use of sales channels
- Ensuring the use of equipment.

However, there is a more thoughtful way of philanthropic activities that is more in line with corporate policies, this is strategic philanthropy. Strategic philanthropy is a form of philanthropy that creates value not only for the donated organization but also for the philanthropic company. Its solution is strategic donation, which simultaneously achieves social and economic goals by leveraging the company's specialized tools and expertise (Porter and Kramer 2002).

The importance of strategic philanthropy was also highlighted by Bruch and Walter (2005). The authors defined four types of philanthropy based on two perspectives – market-orientation and competence-orientation.

The market-oriented company shapes its philanthropic activities in accordance with the expectations and external needs of the stakeholders, it is more important to influence the attitudes of the

stakeholders than to achieve a social result. The goal of a competence-oriented company is to bring philanthropic activity in line with the company's core competence and business activities, which is characterized by a strong internal orientation, the pursuit of philanthropy efficiency, and unique value creation.

When applying peripheral philanthropy, companies rely on the expectations of stakeholders and expect a better competitive position. They carry out activities independent of their core business, which is ethically and economically beneficial, but unsustainable in the long run. Narrowed philanthropy, on the other hand, uses a company's core competencies by ignoring the needs of stakeholders. This, in turn, is a major disadvantage in a competitive environment. There is no strategy behind activities based on scattered philanthropy. It is characterized by lack of coordination, and the goals of support are not clear to managers and employees. Many times, the personal decisions of management are the determinants. This approach can be a good choice in severe crises where rapid action is needed, but the authors believe that a strategic approach can bring greater benefits. Strategic philanthropy is considered the most effective approach by taking into account both the needs of the stakeholders and the internal competence of the company. They are associated with successes such as increasing employee motivation, consumer demand, and building a strong corporate identity (Bruch and Walter 2005).

Fifteen years ago, the concept of venture philanthropy emerged from the side of the strategic approach, the essence of which is that the company views philanthropy as a social investment (Frumkin 2010). Most of all, the new generation of young entrepreneurs represents this approach, but its big disadvantage is that it puts too much pressure on nonprofits.

Drivers of Corporate Philanthropy

The drivers behind the realization of corporate philanthropy should be chosen separately based on whether it is individual, corporate, or industry

motivations. So it is important to treat the executive level separately from company-level and industry-specific motivations, as the leaders of the company make decisions about corporate philanthropic activities.

At the individual level, drivers can be divided into three groups. On the one hand, neoclassical economic theory can be based on the primary motivation, i.e., profit maximization itself. On the other hand, the agency model, which is also supported by Boatsmand and Gupta's (1996, p. 195) "corporate philanthropy can be modeled problem." Third, however, the ethical motivation of leaders also appears.

Company-level motivations are important because companies have different philanthropic attitudes that influence the realization of philanthropy. Motivation is primarily influenced by the sources themselves, whether the company has a separate framework for this, as companies with higher net revenues typically donate more (Burlingame and Frishkoff 1996; Dunn 2004). Advertising costs are also an important factor, as companies also act as PRs. They apply philanthropy (Levy and Shatto 1978), which aims to increase the corporate image. One of the important factors in the philanthropic motivation is also the composition of the board. Corporate philanthropy is an essential tool for internal members to maintain a better corporate image, while external members reject it citing the protection of shareholder interests. The last motivating factor identified by the authors is the social network, according to which the more extensive the social relations system of a leader, the more it supports the realization of philanthropic activities.

Influence at the industry level is also an important factor, as the impact of industry is 20–22% in the field of philanthropy (Amato and Amato 2007), which determines that companies align within the industry, which further strengthens the development of differences between sectors (Seifert et al. 2004). The structure of the industry itself strongly influences the extent of philanthropic activities, according to which monopoly and oligopolistic firms employ a higher proportion of philanthropic activities than firms operating in a competitive environment. At the same

time, it is also crucial for the maturity of the industry that emerging companies are less philanthropic than mature companies. Consumer orientation influences philanthropy in such a way that firms that are in direct contact with the consumer are much more likely to use philanthropy (Fry et al. 1982; Burt 1983; Clotfelter 1985; Feldstein 1975; Steinberg 1990).

Summary

However, when choosing corporate philanthropy as a CSR tool, it is worth considering the following issues:

- What is the purpose of corporate philanthropy, is it a charitable or self-interested activity?
- What does this really mean for the company, it is cost or profit?
- What topic should the company choose, connecting with or separating from its core business?

These challenges are worth thinking about for companies to truly realize the benefits of CP highlighted by Porter and Kramer (2002), such as increasing productivity, expanding the market, strengthening investment in the future workforce, and enhancing the corporate image.

Corporate Purpose

Selina Neri
Hult International Business School, Dubai
Internet City, Dubai, United Arab Emirates

Definition

Corporate purpose can be regarded as the answer to the question “Why do I exist?” (Campbell and

Yeung 1991; Edmans 2017). Given that corporations are powerful institutions whose purpose is to “add value to society” (George et al. 2016, p. 1892), purpose boils down to a company’s reason for being, the role it plays in the world, how it creates value, and for whom. It would seem straightforward to think that companies exist to create value for any group affecting or being affected by its behavior, in other words stakeholders (Freeman 1984) and shareholders, the financial capital providers (Clarkson 1995). In everyday life, it is commonly understood that the purpose of practicing medicine is to heal or prevent, and that the purpose of the law is justice (Byron 1988), or, in consumer terms, that the purpose of a taxi ride is to move people from place to place and the purpose of water is to quench thirst. In other words, there is a human tendency to think of purpose in relation to the most typical use of goods and services. However, what constitutes corporate purpose is not as straightforward, despite shareholder value maximization representing “the most celebrated corporate target” (Loderer et al. 2010, p. 5), under the economic assumption that in a free market and in the absence of externalities, welfare is maximized when companies maximize value for shareholders (Pirson and Lawrence 2010). Externalities, however, do exist in the form of environmental, social, and governance (ESG) factors which constitute a key aspect of the contemporary corporate and investment context (Adler 2016; Powell 2020). ESG are environmental (e.g., waste management, carbon emission reduction, or water consumption), social (e.g., racial tensions or gender diversity, employee engagement, or human rights), or governance (e.g., director independence, executive compensation, or disclosure) factors representing risks and opportunities that relate to corporate purpose or how companies create sustainable value.

Since Aristotle (1981) and Plato (2003), questions around the *telos* (purpose) of business and what constitutes value, how and for whom should businesses create it, have occupied the greatest minds of the world. This entry refers to corporate purpose as sustainable value creation, sustainability relating to financial, social, and environmental aspects of value creation. *Financial* sustainability refers to a corporation’s financial health, its ability

to generate appropriate financial returns, and to honor its obligations both in the short and long run. *Social* sustainability relates to how a company serves societal needs and their evolution (for instance, by discovering natural solutions for sugar reduction in food and beverages, hence contributing to address the problem of diabetes); a corporation's impact on communities (for example, rain forest destruction for the production of palm oil and the consequential damages inflicted on communities). *Social* sustainability also refers to other aspects (and corporate goals), such as employee engagement, happiness and well-being, respect of human rights and dignity, or proactive management of the transition towards more responsible patterns of consumption. *Environmental* sustainability relates to the corporate contribution towards respect, care, and protection of the natural environment, for instance, through carbon emission reduction, energy and water consumption, or waste management and recycling, but also through highly innovative roll-outs of industry 4.0 technologies (artificial intelligence or automation technologies and machine learning) to make production more efficient, safer, and more conducive to positive environmental impact.

Introduction

In the twilight years of the twentieth century, “their world looked wonderful to people living in developed nations (...). Or so it seemed” (Starbuck 2005, p. 21). Scientists also realized that companies were using natural resources faster than their ability to regenerate them. The dawn of the twenty-first century looks quite different and is besieged by challenges. Political turmoil, economic insecurity, social unrest, climate crisis, corporate governance failures, and a crisis of trust towards corporations characterize our time. The world faces “overwhelmingly important challenges” (McGahan 2020, p. 8), despite economic, technological, and social progress.

In this context, corporate purpose has taken central stage and remains the object of debate in the social sciences and among policy makers, investors, and managers. To understand corporate

purpose, its development through history, contemporary views on this topic, and why business is under pressure to live its purpose by creating sustainable value for society as well as for investors (EU 2018; FT 2019), it is important to briefly review the evolution of the corporation and how this trajectory has influenced the evolution of corporate purpose, so that a more comprehensive understanding can be developed around the key issues of purpose and its future developments.

A Brief History of the Corporation

Considered one of “the most successful inventions in history” (Butler 1989, p. 99), throughout history the corporation has been a great contributor to and purveyor of economic development, education, and prosperity. The corporation has been instrumental to the development of humanity and is increasingly associated with the challenges of our time. The corporation is at the heart of the capitalistic system of wealth creation and represents a complex and highly influential social entity (Mayer 2017; Mayer et al. 2017; Williamson 1981). Corporations are omnipresent: they feed us, dress us, take care of our health, build our homes, workplaces, and the infrastructures by which we move and travel, create and manage our digital footprint, manage our savings, and insure us against a variety of risks.

The lineage of the modern corporation traces back to antiquity (Rowland 2005), the earliest examples being associations, universities, holy orders, and cities. Corporate purpose was designed to ensure the uninterrupted functioning of institutions which needed human governance. Historically, cities and churches were the first nonbusiness corporations (Fox 1996; Houseman 1993), while the business corporation only developed centuries later and for very specific purposes. The ancestors of the business corporation, dating back as early as the fourteenth century, were the chartered trading companies of the European economic powers in search of resources and colonies around the globe (McNulty 1972). The first entities for managing businesses were forms of corporations granted in the mid-sixteenth

century by royal charters, for economic purposes including, among others, earning a profit (Morley 2016). The merchant trading companies were partnerships established by royal or parliamentary decree, with the goal of protecting and developing monopoly trading (Rowland 2005), fostering discovery and economic development. As an extension of nations, states, or kingdoms, the origins of the merchant companies were rooted in public interests and also featured a profit purpose (Mayer 2013). The modern corporation was born in 1600, with the establishment of the East India Company under a monopoly and charter granted by Queen Elizabeth I for the development of trade to the east of the Cape of Good Hope. The East India Company represents “one of the world’s first multinationals” (Clegg 2017, p. 45) and its innovations featured the shareholder ownership model and the administrative structure of the modern corporation (Clegg 2017; Robins 2006).

The speculative excesses of high-profile merchant companies, such as the British South Sea Company in the early eighteenth century, damaged public approval of chartered trading companies (McNulty 1972). These excesses are relevant, feature among the first documented corporate scandals, and represent instances where corporate purpose seemed to be essentially about profit. The nineteenth century marked the beginning of freedom of incorporation and the origin of the private corporation. In 1811, the State of New York enacted an incorporation law no longer requiring a charter but simply a general account of the type of business to be undertaken (Perrow 2002; Rowland 2005). Similarly, in Britain, the Joint Stock Companies Act of 1844 allowed corporations to be created with a simple registration and an indicative, brief description of the nature of their activities. These historical developments marked the evolution of the corporation from a public instrument with a clearly defined public purpose to “an all-purpose legal mechanism for facilitating the carrying on of business within a market economy” (Rowland 2005, p. 292). It is at this stage that corporate purpose begins to have in profit “its leading element” (Williamson 1981, p. 1559). This brief history indicates that corporate purpose has historically been rooted in the pursuit of

economic and social goals. Only in the late twentieth century did the dominant aspect of purpose appear to be economic, its social dimension moving to the background, indicating an increasing disregard for how economic goals could be attained.

The Development of Corporate Purpose

Throughout the twentieth century and to the present day, corporate purpose has been of interest to many disciplines of the social sciences, such as the humanities, economics, corporate law, and management.

The humanities view organizations as social entities essential to the relational nature of mankind (Pirson and Lawrence 2010). Focus on purpose is connected to a generally accepted acknowledgment of the interdependence of business and society. Over 2400 years ago, in his work *The Politics*, Aristotle (1981) regarded human beings as social animals, with a tendency to associate, create, and live in communities. Sociability relates to the ability to empathize with others, to cooperate with and help fellow humans (Melé 2011), and offers an explanation for the roots of business organizations and society. In modern times, this view of humans extends to corporations, regarded as communities of people and to business endeavors as aiming at the creation of economic and social value (MacIntyre 2007). Theology offers a broader perspective on life, relevant to the business world (Loomis 2006), therefore important in understanding corporate purpose. Business is regarded as a pursuit of “theological significance” (Byron 1988, p. 525) and a “dignified activity” (Uddin 2003, p. 26), not just an activity to be tolerated or allowed. “The nature and purposes of corporations are unavoidably religious” (Colombo 2017, p. 814), as purpose is linked to serving society. In theology, human endeavors are neither atomistic nor altruistic, rather, they are about doing something for others on the condition of receiving something of fair value in return (Byron 1988; Hollensbe et al. 2014). This is an important point, supporting a view of corporations as human enterprises that are

commercial at heart and emphasizing the importance of *how* corporate goals are achieved. A considerable body of literature acknowledges that humans are born to interrelate, perceiving themselves as part of a bigger whole (Crocker and Canevello 2015; Rynes et al. 2012). Even though assumed to be self-interested (Miller 1999), humans do possess the ability to empathize, be compassionate, and are motivated by caring about others, as no person and no human endeavor (such as corporations) exists in a vacuum (Crocker and Canevello 2015; Mikulincer and Shaver 2005). In fact, among the root causes of the challenges of the world is a failure to consider the relational nature of the corporation (Cremers 2017; Kochan 2002) and a lack of regard by corporations for the effects of their actions on others. Somehow, since Adam Smith's observation in 1776 that profit as corporate purpose was by no means "all that it is needed" (Berry et al. 2013, p. 583), the social dimension of business undertakings has been overlooked or disregarded.

In economics, corporate purpose as shareholder value is "the most celebrated corporate target" (Loderer et al. 2010, p. 5), and it has been argued that "the ultimate purpose of the firm is to maximize profits" (Conner 1991, p. 123). A preoccupation with the optimal use of scarce resources runs through the history of economics, the corporation being an important element in the larger mechanism of the market economy, in turn regarded as an instrument for converting self-interest into social welfare. The system is assumed to "work itself" (Coase 1937, p. 387) and features a rational, self-interested *homo economicus* (Anderson 2000). In classical economics, corporations are organizations obtaining resources for production, and are supposed to make money through sales activities, although economists have long noted that money also needs to be embedded in moral and social norms (Polanyi 1944; Turnbull 1997; Smith 2010). Already in 1817, economist and entrepreneur Owen warned that corporate purpose as economic aims only would have far-reaching effects on society and needed to be tempered with "conscious social direction" (Polanyi 1944, p. 134). The Chicago School of neoclassical economics regarded

purpose as being about efficiency improvements and human motives driven by self-interest (Sen 2013; Stigler 1971). The common interpretation of Milton Friedman's (1970) publication in *The New York Times* holds that for Friedman, corporate purpose was to increase profits, however he added that this is to be achieved "so long as it stays within the rules of the game" (p. 22) and "while conforming to the basic rules of the society, both those embodied in law and those embodied in ethical custom" (p. 33). Common wisdom has overlooked Friedman's attention to the *how* of purpose or how value is created. Given that rules of society, the law and ethical customs are contextual and changing, *how* economic goals are achieved is as important as the goals themselves. In neoclassical economics, a view remains that in the rational pursuit of one's own interest, there is no space for morality, social commitment, or care, since companies exist because they possess superior abilities to efficiently temper opportunistic behavior through the exercise of control (Williamson 1979). Nonetheless, neo-classical economists also noted that this reasoning has limitations (Coase 1960; Dobson 1999; Polanyi 1944), as it ignores the context of human actions and motivations, companies' broader economic objectives and the role a shared purpose can play in creating context for the evolution of a corporation (Ghoshal and Moran 1996). Thus, in economics, a nuanced view of corporate purpose can be found, and it is acknowledged that purpose might exercise a tempering effect on the legitimate business pursuit of economic goals. Corporate purpose can therefore play a role in the reconciliation of societal and business expectations with respect to corporate aims and *how* they are achieved.

In corporate law, it is quite difficult to find support for corporate purpose as shareholder value maximization (Deakin 2005). Ever since the creation of the notion of corporate personhood, academics and legislators have debated its purpose and the obligations of those who direct it (Lan and Heracleous 2010; Letza et al. 2004; Wallman 1999). In the USA, ever since the famous Berle-Dodd dialogue of the 1930s on the topic of in whose interests should a corporation be managed (Weiner 1964), common wisdom holds that powers granted to a corporation should be

exercised in shareholders' interests. However, a careful review of the dialogue indicates that Berle and Dodd agreed that a company should be managed in the interests of shareholders but disagreed on how other interests should be taken into account (Licht 2004). A substantial body of literature examines this topic (Allen et al. 2007; Bapuji et al. 2020; Blair 1995; Cremers et al. 2019; Hinna and Monteduro 2017; Mahoney and Qian 2013; Porter and Kramer 1999; Tirole 2001), and the meaning of shareholder value maximization remains the object of debate. Beyond terminology, what is really meant by shareholder value is maximization of the equity market price for the shares of listed corporations (Dobson 1999) or share price maximization (Hansmann and Kraakman 2000; Wallman 1999). This is possibly a flawed measurement of value to begin with, as the stories of WorldCom, Enron, or Lehman Brothers (among others) indicate. Some corporate law scholars hold a broad view of purpose (Blair and Stout 1999; Clarke 2013; Stout 2012, 2013; Weinstein 2013), while others note that not even countries assumed to be the most shareholder-friendly (such as the USA or the UK) have a legal requirement for managers and directors to act in the sole interest of shareholders (Loderer et al. 2010). In most legal systems, regulation requires or recommends acting in good faith and in the interests of the corporation (Clarke 2013; Deakin 2005), although what these interests might be is open to interpretation. In this regard, it is worth noting one of the most remarkable developments of the last decade (Mayer 2017) in the area of corporate personhood and purpose. Following growing dissatisfaction with shareholder primacy, legislators in the USA have allowed the incorporation of an entity as a public benefit corporation (B-corporation) (Alexander 2016; Mayer 2016), with a formal public purpose beyond commercial aims (Steingard and Clark 2016). Other countries such as France, the UK, and Italy have followed suit.

In management scholarship, although shareholder value is the "leitmotif of wealth creation" (Windsor 2001, p. 226), it has come under increasing scrutiny as corporate purpose (Martin et al. 2016). Stakeholders, shareholders and

society are increasingly exposed to the costs and risks of corporate actions (Letza et al. 2004; Phillips et al. 2003; Schneider and Scherer 2015; Turnbull 1997), as corporations are cultural and social systems (DiMaggio and Powell 1983; Judge et al. 2008), reflecting societal values and playing a broader role in our lives (Hatch 2013; Selznick 1957). A view has developed that commercial and social goals can coexist (Garriga and Melé 2004), and that the satisfaction of stakeholder interests can be instrumental to corporate purpose as sustainable value creation (Campbell 2007; Hillman and Keim 2001; Hillman et al. 2001; Kumar and Zattoni 2019; Mitchell et al. 1997; Ogden and Watson 1999). Revlon's use of chemicals linked to cancer in its products; Kimberly-Clark's destruction of forests for throw-away tissues; the mining industry's giants such as Glencore or BHP use of child labor in cobalt and lithium extraction, and the ethical and legal issues these pose to their customers (Coles 2019; Gunther 2015; Hume 2019), are all indications that purpose needs to assume a broader dimension.

Corporate Purpose in the Twenty-First Century

Reviewing the historical development of corporate purpose, the key insight of this much-debated concept and the contrasting views presented above, lies in the recognition that purpose has various dimensions (financial, social, environmental) which can be complementary, and that if corporations are to create sustainable value, there is a need to look beyond simply maximizing shareholder value (Edmans 2017; Hollensbe et al. 2014; Martin et al. 2016; Mayer 2017). The Edelman (2020) Trust Barometer, a survey with over 33,000 participants in 28 countries, continues to report a collapse in trust towards business. Such a pervasive crisis of trust has reached the level of a systemic threat to humanity (Edelman 2020). Expectations that business will promptly address the issue are high (Bansal and Song 2017; George et al. 2016; Hill 2019; Mayer 2017; Pirson et al. 2017), as trust, or the lack of it,

matters, as trust is indeed the “lubricant of society” (Luhmann 1979, cited in Pirson et al. 2017, p. 1). Therefore, a new consideration is needed of the way business is conducted and governed (Mayer et al. 2017; Metcalf and Benn 2012; Pirson and Lawrence 2010).

Through the exercise of their stewardship duties investors, as capital providers, increasingly integrate ESG factors in investment decisions (Espahbodi et al. 2019; Van Duuren et al. 2016). ESG factors represent business risks and opportunities that are anything but tangential to business, as they can impact a company’s bottom-line. ESG factors are fundamental to how corporations access capital and create sustainable value; in other words, they are fundamental to corporate purpose. ESG can act as indicators of risks and opportunities that may affect a corporation’s ability to create value and to attract capital. For instance, they can point to upcoming regulation (as was the case in the Facebook Cambridge Analytica scandal of 2016, which accelerated the European General Data Protection Regulation). They can be instrumental in shifting consumer preferences (for instance, towards healthier food and lifestyles) or affect a corporation’s ability “to produce people” (Hollensbe et al. 2014, p. 1229), in other words committed and dedicated employees.

ESG factors are intimately related to corporate purpose and represent many of the externalities of the contemporary business and investment context. They encapsulate potential risks and opportunities for both investors and companies along environmental, social, and governance dimensions. Throughout history, nature has been disruptive, yet climate change is accelerating the urgency of tackling environmental problems. Social unrest has also always existed, whether in ancient Greece due to wealth and land inequality (Fuks 1984), in the city of Norwich in Tudor England following disastrous harvests (Hoskins 1964), in Somalia, Rwanda, and the former Yugoslavia following poverty and unemployment in “the lost decade of the 1980s” (Chossudovsky 1997, p. 1786), or in Hong Kong in the summer of 2019 (Korner 2019). Governance issues (and scandals) are also not new, with regulation aimed

at improving governance effectiveness and strengthening control. What is different now is the immediacy, the scale and the global effects of the consequences of such events, giving added urgency and importance to the response to and anticipation of them, hence the centrality of corporate purpose and of the integration of ESG in the processes of value creation. ESG factors represent “a tragedy (...) and a golden opportunity for positive system change” (Kiernan 2007, p. 478), because they represent environmental factors (e.g., waste generation, carbon emission reduction, water or renewable energy consumption, or other aspects of the climate transition); social factors (e.g., gender diversity, social inequality and tensions, product safety, employee engagement, or human rights); and governance factors (director independence, executive compensation or disclosure), all linked to corporate purpose or how corporations create value for society as well as investors.

In the twenty-first century, corporations, particularly global corporations (Mayer 2016, 2017) have considerable market, social, and political power (Mayer et al. 2017; Starbuck 2014). They are becoming the new leviathans (Chandler and Mazlish 2005; Mayer 2013), swiftly exploiting regulatory gaps and national differences for their own benefit (Schneider and Scherer 2015). These “new supernatural organizations” (Beck 2008, p. 794) are among the “world’s most powerful social entities” (Phillips et al. 2003, p. 1) and are expected to contribute to finding solutions to the challenges of our time (Priem et al. 2018; Scherer and Smid 2000). Contemporary challenges are beyond governments’ capabilities, and public money will not be sufficient to finance a sustainable economy (EU 2018). Investment and business communities, therefore, have a role to play in building a sustainable future anchored in purposeful business. Initiatives such as *The Purposeful Corporation* (Big Innovation Centre 2017), launched in the UK; the call of the Academy of Management for the *Future of the Corporation* (Mayer et al. 2017; Phan et al. 2016); the *Future of the Corporation* program of the British Academy (2017); and US senator Elizabeth Warren’s

proposal of the *Accountable Capitalism Act* (Indap 2018) are testimony to the rising interest in corporate purpose and its role in the future of humanity. The corporation is in need of reinvention as a vehicle to promote the interests of society and investors (Mayer 2016, 2017). By placing corporate purpose at the heart of business, so that it can drive sustainable value creation, and by creating an investment and regulatory context in support of corporate purpose as the reason for being of corporations, there is a promise of positive, systemic change that can begin to address some of the challenges of this century.

Summary

This chapter presents an overview of corporate purpose or the reason why corporations exist. It traces its developments through the humanities, economics, corporate law and management scholarship through the twenty-first century, concluding with the key issues and future developments around corporate purpose as the creation of sustainable value along financial, social and environmental dimensions.

Definition

Corporate social performance (CSP) is defined as a business organization's configuration of principles of social responsibility, processes of social responsiveness, and observable outcomes as they relate to the firm's societal relationships (Wood 1991, 2010).

Introduction

No consensus exists on how to measure responsibility (or Corporate Social Performance), and it is extremely difficult to evaluate it quantitatively.

To demonstrate that a company is socially responsible, it is necessary to translate the CSR principles into measurable variables by using standards and indicators, so that a social auditing process can be subsequently performed from which conclusions can be drawn about the

company's rating from a social and environmental perspective.

The process for determining whether a company is socially responsible (the social audit) consists of two stages:

- Standardization: this consists of the drafting, publishing and application of standards which lay down the principles for guaranteeing CSR.
- Certification: the procedure and the outcome of an independent agency's process of ensuring that a company abides by the standard, referred to as *screening or social rating*.

It is believed that more than 225 CSR standards or principles exist, as well as numerous certification processes for recognizing compliance with the respective CSR standards. Therefore, it has been proposed that the procedures employed for measuring social performance should be standardized and their number reduced.

Table 1 contains a list of the main standards, certification systems, and instruments that are used

to identify the extent of CSR within a company. Adherence to the standards, gaining the appropriate certificates, and drafting sustainability reports are thus considered as Corporate Social Performance actions. The asterisk indicates whether the three triple-bottom-line dimensions (economic, social/corporate governance, and environment) have been considered.

Codes of Conduct

The main ones are described below.

OCDE Guidelines for Multinational Enterprises

The *OCDE Guidelines for Multinational Enterprises*, published in 2000, are recommendations applied by governments to multinational corporations that operate or have their headquarters located in countries that have adopted the recommendations. They contain nonbinding principles and rules on responsible business conduct in a global context that conform to applicable

legislation and internationally recognized rules. The *Guidelines* are the only exhaustive and multilaterally agreed code of conduct for business responsibility that exist, which governments have undertaken to promote.

The recommendations contained in the *Guidelines* express the values shared by the governments of the countries that are the source of a large part of direct foreign investment and where the headquarters of many of the largest multinational corporations are based. The aim of the *Guidelines* is to encourage businesses to make a positive contribution to economic, environmental, and social progress throughout the world. The *Guidelines* concentrate on the following aspects: dissemination of information, human rights, employment and labor relations, the environment, combatting corruption, consumer affairs, science and technology, competition, and tax issues.

United Nations Global Compact

The UN Global Compact, launched in 2000, calls on companies to align their strategies and operations with ten universal principles, on human rights, the environment, labor laws and the fight against corruption, and to take steps to promote the Sustainable Development Goals (SDGs). By 2018, over 12,500 companies in more than 160 countries had signed up to the project.

ISO 26000:2010

ISO 26000 guides companies and organizations on how to operate in a socially responsible manner. This implies acting ethically and transparently in order to contribute to the health and wellbeing of society. It helps companies gain an understanding of what CSR is, helps to translate responsible behavior principles into concrete actions, and spreads social responsibility best practice across the globe.

It revolves around seven fundamental issues: organizational governance, human rights, labor practices, the environment, fair-trading practices, consumer affairs, and active participation and community development.

Unlike other ISO standards, ISO 26000 cannot be certified, as it is simply a guide on how to behave rather than a requirement laying down obligatory actions.

It is aimed at all types of organizations, regardless of their business activity, size, or location.

AA1000 AccountAbility Principles Standard 2008

The AccountAbility Principles Standard (AA1000APS) offers a framework that allows companies to identify, prioritize, and respond to the challenges of sustainability.

AccountAbility is a global leader in providing innovative solutions in the field of CSR and sustainable development. Since 1995, the AA1000 standards have been based on principles relating to questions such as corporate governance, business models, organization strategy, and assuring sustainability and stakeholder commitments.

Management and Certification Systems

Working Conditions Health and Safety

SA 8000

This is an auditable certification system, created by Social Accountability International in 1997 and updated in 2001. It aims to promote better working conditions throughout the value chain.

OSHAS 18001 (Occupational Health and Safety Assessment Series)

OHSAS 18001 is an internationally accepted standard that defines the requirements for setting up, implementing, and operating an effective Health and Safety Management System at work and which can be audited and certified externally. It was developed by the British Standards Institution (BSI). OHSAS 18001 was replaced by ISO 45001, the international standard on health and safety at work. The organizations already certified with the BS OHSAS 18001 must update their management system to the ISO 45001 standard by March 2021 at the latest.

Environmental Management Systems

ISO 14001

The ISO 14001 standard is the international standard for environmental management systems (EMS), which helps companies to identify, prioritize, and manage environmental risks as part of their usual business practice.

It was designed to be easily implemented by any organization, regardless of its size, industry, and geographic location. Several agencies have the task of conducting the certification process to verify whether or not companies are complying with the requirements set out in the standard.

EMAS (Eco-Management Quality Scheme)

This is a European Union voluntary standard, launched in 2009, that recognizes the organizations that have introduced an Environmental Management System and have committed to pursue continuous improvement, verified by independently conducted audits.

Carbon Disclosure Project (CDP)

This allows companies that use it to obtain a true diagnosis of their carbon footprint and to define a baseline for their emissions. As a whole, this initiative is also a methodological guide for evaluating the risks posed by companies' environmental management methods.

Quality Management Systems

EFQM (European Foundation Quality Management)

The EFQM model, as a total quality model, is a model for excellence that any organization can use and apply. It was created in 1988 by the European Foundation for Quality Management and is a results-orientated and customer-focused model. The management of this model relies on the participation of all members of the organization and takes account of ethical and social aspects.

Unlike other quality improvement models, the EFQM is based on self-assessment, which is not certified or accredited, and organizations may

perform the self-assessment process with or without outside support.

ISO 9001

The ISO 9001 forms the basis for quality management systems as it is an international standard that encompasses all the components of quality management a company must have in place in order to implement an effective system that allows it to manage and improve the quality of its products or services.

Information Generation *Global Reporting Initiative (GRI)*

Global Reporting Initiative was set up in 1997 as a joint initiative of the UN Environmental Programme (UNEP) and the CERES organization in order to raise the quality, accuracy, and usefulness of sustainability reports. It aims to create a global framework of voluntary information about the economic, social, and environmental impacts of businesses. To set up this framework, the GRI drafted what is called the *Sustainability Reporting Guidelines*, which have been periodically updated and improved since they were first published in 2000, including the GRI 2002, the G3, released in October 2006, and the current G4, approved in May 2013.

In all the guidelines, the *TBL focus* of the information is maintained through the separate provision of **58 economic, social, and environmental indicators** (with two levels of compliance based on the number of indicators about which information is provided: *Core* – less information and *Comprehensive* – more information). The G4 aims to be a reliable and credible framework on which to base sustainability reporting and which can be used by all organizations irrespective of their size, industry, or location. The goal of G4 is to enable reporting organizations to concentrate on the analysis of their economic, social, and environmental impact, especially negative impacts, including a description of their dialogue with stakeholders, the involvement of senior management, the commitments acquired, and the mechanisms for monitoring the improvement actions.

Future Directions

Corporate Social Performance will need to measure how companies comply with Sustainable Development Goals (SDGs) that were adopted on September 25, 2015, by 193 countries as a follow-up to the Millennium Development Goals. The SDGs focus on ending poverty, protecting the planet and ensuring prosperity for all, as part of a new sustainable development agenda. A total of 17 goals and 169 targets have been set up, to be achieved by 2030.

Definition

According to United Nations Industrial Development Organization (UNIDO) (2019), “Corporate Social Responsibility is a management concept whereby companies integrate social and environmental concerns into their business operations and interactions with their stakeholders. CSR is generally understood as being the way in which a company achieves a balance of economic, environmental and social imperatives (‘Triple-Bottom-Line-Approach’), while at the same time addressing the expectations of shareholders and stakeholders. In this sense, it is important to draw a distinction between CSR, which can be a strategic business management concept, and charity, sponsorships or philanthropy. Even though the latter can also make a valuable contribution to poverty reduction, and directly enhance the reputation of a company and strengthen its brand, the concept of CSR clearly goes beyond that.”

The European Union’s Green Paper (2001) defines CSR as a concept “whereby firms integrate social and environmental concerns into their business operations and in their interaction with stakeholders on a voluntary basis.”

However, despite its long history, no consensus has been achieved on the definition of CSR (Sheehy 2015). Dahlsrud (2008) analyzed 37 definitions used by CSR researchers and concluded that they are based on five dimensions: the

environmental, social, economic, stakeholder, and charity dimensions.

Introduction

In the late 1990s, there was a significant surge in interest in CSR, arising out of the financial crisis and particularly following the dotcom boom, which had led to a credibility crisis among large corporations and undermined the legitimacy of large business concerns and even of the market itself in the eyes of the society (Albareda and Balaguer 2007). This scenario led to a growing demand for the relationship between business and wider society to be based on ethical and responsible behavior.

There is an increasing number of companies that are looking to get fully on board with CSR as they become more acutely aware that in today's market economy, their legitimacy as an operator is afforded by the players or **stakeholders** with whom the organization has a relationship: customers, staff, suppliers, competitors, nonprofit bodies, financial institutions, investors, and the community in general. The company's purpose is therefore broadened to encompass, not just maximizing company value for shareholders (shareholder focus), but also to meet the needs of all groups and individuals who affect or are affected by the company's business activity (stakeholder focus). Today, more heed is paid to the various groups of stakeholders, whose different concerns, demands, and expectations must all be listened to.

CSR is based on the concept of **sustainable development**, which was first coined by the Brundtland Committee (1987) and later adopted by the Rio de Janeiro Earth Summit in 1992. It is defined as "Development that meets the needs of the present without compromising the ability of future generations to meet their own needs." In this regard, the World Sustainable Development Council defines CSR as "the continuing commitment by business to contribute to sustainable economic development while improving the quality of life of the workforce and their families

as well as of the local community and society at large."

Based on this concept of Sustainable Development, Elkington (1997) introduced the phrase "**Triple Bottom Line**" (TBL) as applied to business management. He defines it as "a commitment to simultaneously strive towards economic prosperity, environmental quality and social justice." As such, the goal of a company should not focus purely on the financial bottom line, but should aim to operate in a balanced manner, taking account of the economic, social, and environmental aspects.

A variety of approaches to CSR exists across the globe. According to Vives and Peinado-Vara (2011), there are three distinct CSR perspectives, depending on the geographic region.

- **The United States:** It is fair to say that the United States is the society that has most clearly expressed its respect for the free market and for unfettered competition. Although the State has intervened occasionally to regulate the market during critical times, it has on the whole promoted the entrepreneurial spirit and individual enterprise. Within this framework, companies have played a significant social role. A preoccupation with work productivity and a concern for the environment led the culture of philanthropy to evolve into a more integrated understanding of CSR.
- **Europe:** Companies have incorporated the concept of sustainable development into their management models, with a greater degree of State intervention in social and economic matters.
- **Latin America:** Characterized by paternalism, a marked inequality in income distribution, a concentration of political, economic, and social power, widespread poverty, and insufficient regulation. Medium and large firms have helped to mitigate the inequalities through their philanthropic actions. Dismantling this paternalistic, dependent, and philanthropic culture and building another one based on social responsibility is a huge challenge that some business and society leaders have decided to take on.

Key Issues

Based on the above definitions, the following key characteristics of CSR can be defined:

- **Voluntary nature:** The decision of a firm to concern itself with social and environmental matters is a voluntary one rather than being legally imposed. In this respect, CSR goes beyond anything that is legally required.
- **Integration:** CSR initiatives should be integrated into the day-to-day operation of the company, in all its business divisions and areas. CSR cannot be sporadic, piecemeal, or a marginal concern.
- **Consistency:** The initiatives must be sustained over time. CSR is a shift in philosophy, culture and in the way of doing things, all of which must be permanently maintained.
- **Transparency:** Organizations that assume their responsibilities toward the society in which they operate must be ready to report diligently and truthfully about their actions and decisions in relation to aspects that are important to the various groups of stakeholders.

According to the UNIDO (2019), key CSR issues are environmental management, eco-efficiency, responsible sourcing, stakeholder engagement, labor standards, and working conditions, employee and community relations, social equity, gender balance, human rights, good governance, and anticorruption measures.

A properly implemented CSR concept can generate a variety of competitive advantages, such as enhanced access to capital and markets, increased sales and profits, operating cost savings, improved productivity and quality, an efficient human resource base, improved brand image and reputation, enhanced customer loyalty, and better decision-making and risk management processes.

In essence, CSR consists of consolidating financial success and gaining a competitive advantage by building a good reputation and earning the trust of people who work for the company or who live close to it.

CSR is not new. Most companies, especially small businesses, have always been close to their community and have tried to be a good member of

the society as long as business and commerce has existed. Indeed, many business leaders know instinctively that behaving correctly – satisfying customers, motivating staff, considering their suppliers, being an upstanding member of the community and protecting the environment – has an impact on financial return.

Briefly, **what does CSR bring to the company?**

- It can strengthen the corporate culture.
- With respect to the staff, it can contribute to attracting and retaining talent. Increased work-force productivity.
- It can be the basis for the business strategy, as a differentiating factor, providing a competitive advantage in the market. Access to new markets.
- It can help to earn the trust of customers, staff, shareholders, and suppliers.
- Easier access to capital.
- Affords the business legitimacy and helps to build loyalty.
- Enhances corporate image and reputation.
- Improved risk control.
- Contributes to the local environment and development.

Incorporating CSR into the corporate culture is not only, therefore, beneficial to society but also to the companies who introduce it. It fulfills the “win-win” approach, in which everyone benefits. Companies gain a strong **competitive advantage** over their rivals, since their actions in this field are valued positively by consumers. This leads to an improved brand image, better positioning on the market, easier access to capital, more stable relationships with their stakeholders and the creation of value.

But, **can it be confirmed that CSR is profitable?**

CSR is a very broad concept that includes many aspects and which does not take the same form in all sectors and industries (Waddock and Graves 1997). For this reason, there is no consensus on the methods of measuring responsibility (or the profitability of CSR), and it is extremely difficult to make quantitative valuations. This is one of the most important factors in establishing a conclusive relationship between a company’s financial and social performance.

Despite this difficulty, most of the research undertaken in this regard concludes that a management policy based on CSR criteria does not lead to a diminished financial performance, and points to the existence of a positive link, or a neutral one in some cases, between a company's social and financial performance.

One such piece of research is the study carried out by Roman, Hayibor, and Agle (1999), who developed the work of Griffin and Mahon (1997) by delving deeper into the link between social and financial performance. They concluded that out of the 52 studies analyzed, 33 confirmed the existence of a positive link between social and financial performance, 14 studies showed it to be neutral, whereas just 5 observed a negative link between the two evaluation measurements. The work by Margolis and Walsh (2001), which analyzed 122 studies on the link between CSR and financial performance, reached similar conclusions.

In another notable study, Simpson and Kohers (2002) looked at the relationship between CSR and financial performance in an attempt to decide whether there is any causality between them. Using data from the banking sector, the authors confirmed that there is a positive link between CSR and financial performance, but they were not able to determine whether a CSR policy leads to better financial performance or vice versa.

Introducing CSR should not therefore be considered as a cost, but as an investment, which will yield returns over the medium and long term, in both tangible terms (with savings on electricity, water, production processes, etc.) and intangible ones (with the company gaining competitiveness, improvements to the organization, structure, staff motivation, productivity, etc.). To conclude, a company with a CSR policy will likely be more competitive, and a greater investment in CSR will lead to improved financial performance in the medium to long term.

Future Directions

The social and economic changes of recent decades have clearly contributed to the **development of CSR as a business strategy**:

- **Economic globalization:** The colossal size of the organizations and multinational firms that operate in nearly every country in the world means that any decision they take can have an impact on the economy of those nations. It must also be remembered that these organizations have part of their production process or their supply chain in developing countries due to the lower production costs in these countries. In these areas of the world, the laws governing environmental and social issues are not on a level with the legislation of developed nations, which can occasionally lead to human rights violations. This has resulted in considerable social awareness about how large multinational corporations operate in these parts of the world.
- **Advances in communications:** The Internet as a vehicle of communication has enabled millions of people to learn about what is going on in the world in real time. It is possible to read about what any business is doing, and the benefits and threats of the products sold online, and on occasions it has led boycotts of large multinationals prompted by their irresponsible behavior.
- **Business scandals:** The big financial scandals in both the United States and Europe have generated considerable distrust with the stakeholders in the companies losing all credibility. Whereas at the beginning of 2008, climate change was at the top of companies' CSR agendas as they enjoyed a period of prosperity, following the fall of Lehman Brothers (one of the largest investment banks in the United States) in September 2008, with the ensuing financial and economic crisis, a questioning of values and the loss of trust that persisted for many years thereafter, CSR became more necessary than ever. As Warren Buffet warned, "only when the tide goes out, do you discover who's been swimming naked." As a result, a plethora of rules and laws have been drafted with the purpose of increasing information transparency within organizations.

The issue of CSR is receiving increased attention as a result of the 2030 Agenda for Sustainable Development.

Sustainable Development Goals (SDGs) were adopted on September 25, 2015 by 193 countries as a follow-up to the Millennium Development Goals. The SDGs focus on ending poverty, protecting the planet and ensuring prosperity for all, as part of a new sustainable development agenda. A total of 17 goals and 169 targets have been set, to be achieved by 2030, and their accomplishment calls for a collective effort from government, corporate, and civil society organizations.

Institutionalism; Institutionalized environment; Institutions; Socially responsible behavior

Definition

Corporate social responsibility (CSR) and institutional theory are linked. The fundamental basis of the link between CSR and institutional theory is through legitimacy.

One of the features of the CSR practices adoption in business is the voluntary nature. Several authors reflect this fact in the definition of what should be a social responsibility.

CSR was defined by the European Commission (2001: 6) as “a concept whereby companies integrate social and environmental concerns in their business operations and in their interaction with their stakeholders on a voluntary basis.” This orientation was reinforced by the European Commission that refers to a better behavior by companies through the adoption of credible and transparent social practices, indicating the transparency like an essential component. In order to achieve responsible business management, the

European Commission presented a new CSR definition as “the responsibility of enterprises for their impacts on society” (European Commission 2011: 7). Other authors define CSR “as the duty of the companies to the development of its stakeholders and to the avoidance and correction of any negative consequences caused by business activities” (Muthuri and Gilbert 2011: 467). This definition incorporates the notion that corporate social responsibility has responsibilities to the society.

There are a variety of CSR’s definitions, and most definitions make explicit reference to sustainable development and integrate the three pillars of the Brundtland Report: “environmental, social, and economic well-being” (Lamarche and Bodet 2018: 155).

Institutional theory “addresses the deepest and most resilient aspects of social structure; considers the processes by which structures, including schemas, rules, norms and routines, are established as authoritarian guidelines for social behaviour; asks how these elements are created, diffused, adopted, and adapted throughout space and time; and how they fall into decline and disuse” (Scott 2004: 2).

This theory emphasizes society’s expectations and behavior appropriately, which acts as a “taken-for-granted belief system” (Suchman 1995: 577). In other words, institutional theory “focuses attention on the existence of a set of differentiated and specialized cognitive and normative systems-institutional logics-and patterned human activities that arise and tend to persist, in varying form and content, in all societies” (Scott 1987: 500).

According to Brammer et al. (2012: 8), “applying the lens of institutional theory to the study of CSR, allows for a better understanding of business responsibilities in two chief aspects: the *diversity* of CSR and the *dynamics* of CSR.”

- *The diversity of CSR* – assuming different forms in different countries.
- *Dynamics of CSR* – the concept and its applications have changed over time (Brammer et al. 2012).

Thus, there is significant variation among countries in the meaning and motivation of CSR activities, exemplifying the following:

- In European countries, social responsibility is understood as the integration of socially responsible practices into the very activities of business and wealth creation (Blasco and Zølner 2010).
- In the United States of America, a philanthropic model predominates, whereby wealth is first created and then channeled into social causes through foundations (Montuschi 2004).
- Countries like India is dominated by family-owned companies and attribute charity and philanthropic activities to CSR (Bhaduri and Selarka 2016).

In fact, institutional theory, with its varied and long tradition in social sciences (Scott 2001), has been a useful theoretical lens for understanding the effects of the institutional environment on CSR behaviors of firms (Campbell 2007). Thus, the “approach in the *comparative CSR literature* reflects the variability in the relevance of CSR practices according to country institutional characteristics” (Witt and Miska 2019: 5).

As argued by Gond and Moon (2011: 3), CSR has “emerged in very different national contexts, reflecting different corporate governance, institutional, economic, political, social and ethical contexts,” being that CSR does not work in an empty social context and CSR practices are more likely to be adopted and become effective as they are incorporated into specific sets of institutions (Jackson and Apostolakou 2010).

Indeed, “Rather than seeing CSR purely as a realm of voluntary action, institutional theory suggests seeking to place CSR explicitly within a wider field of economic governance characterized by different modes, including the market, state regulation and beyond” (Brammer et al. 2012: 7).

Introduction

Institutional theory is based on three essential pillars of institutions – regulatory, normative,

and cognitive – to illustrate how institutions can define the nature and the extent of socially responsible corporate behaviors (Scott 2001). Thus, those three elements have a different emphasis and lead to different implications.

- *Regulative* (legal) elements “include rules, sanctions and regulations which tend to codify socially accepted corporate behaviour” (Muthuri and Gilbert 2011: 469).
- *Normative* (social) elements are the values and social norms that define the “rules of the game” (Marquis et al. 2007: 934). Normative values are set by a variety of social actors including the media, institutional investors, NGOs, educational and professional associations, and social movement organizations.
- *Cognitive* (cultural) elements “include cultural values, ideology and identity – cognitive frameworks encompass common or shared beliefs about what constitutes responsible corporate behaviour” (Muthuri and Gilbert 2011: 469).

The three pillars that act as support for institutional theory take on an emphasis different to give scope to what they interpret as legitimate organizations.

According to Suchman (1995: 574), *legitimacy* “is a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions.”

A legitimacy threat occurs “when a company’s behaviour is perceived as not in accordance with society’s norms” (Farache and Perks 2010: 236).

Suchman (1995) identifies three major types of organizational legitimacy that depend on different dynamics:

- *Pragmatic*, based on public self-interest
- *Moral*, based on normative approval
- *Cognitive*, based on understanding, goes beyond evaluation and self-interest and involves an affirmative support or mere acceptance of the organization, based on some acquired data of cultural consideration

Legitimacy theory “posits that organisations continually seek to ensure that they operate within the.

bounds and norms of their respective societies” (Brown and Deegan 1998: 22). These norms change across time, requiring the organization to be responsive, there being a “social contract” between the organization and those affected by the organization’s operations, and it is expected that the organization will comply with the terms of this “contract” and those expressed or implied terms are not static (ibid.).

The academic literature on institutions and CSR reflects the variation in the conceptualizations of visible institutions in the social sciences (Witt and Miska 2019).

Broadly speaking, there are three major forms of institutionalism: *sociological*, *historical*, and *rational choice* institutionalism (Hall and Taylor 1996).

- *Sociological institutionalism* defines institutions as “regulative, normative, and cultural-cognitive elements that, together with associated activities and resources, provide stability and meaning to social life” (Scott 2014: 56). Central to this approach is the phenomenon of isomorphism – “refers to the adaptation of an institutional practice by an organization” (Dillard et al. 2004: 509). Sociological institutionalism is “the most commonly used type of institutionalism in the study of CSR as well as in the business and management literature in general” (Witt and Miska 2019: 2).
- *Historical institutionalism*, by contrast, is more common in political science and socioeconomics, but to some extent also in parts of economics. Institutions here are seen as “humanly devised constraints that structure human interaction” (North 1990). That is, institutions are seen as political projects.
- *Rational choice institutionalism* is most commonly found in economics and in political science. In this conceptualization, engaging in CSR is a matter of self-interest rather than a concern with legitimacy or the result of the rules of the game created through political processes (Witt and Miska 2019). The basic

assumption underlying rational choice institutionalism is that actors are opportunistic (Williamson 1985).

Some works have investigated how companies’ CSR initiatives, practices, and approaches affect and change institutional settings and environments. The question of why would corporations behave in socially responsible and in different national contexts has been studied by several authors (Campbell 2007; Matten and Moon 2008).

Campbell (2007) presents an institutional theory on CSR that comprises a series of propositions that specify the conditions in which companies are more or less prone to behave in a socially responsible way.

In this regard, Campbell (2007: 951) defines *socially responsible companies* as those that “not knowingly do anything that could harm their stakeholders,” and “if corporations do cause harm to their stakeholders, they must then rectify it whenever the harm is discovered.” This author states that such behavior “may mean different things, in different places, to different people and at different times” (Campbell 2007: 950).

The theoretical framework developed by Campbell (2007) suggests that the relationship between the organization’s financial condition and its socially responsible behavior – associated with the substantive aspects of CSR – is mediated by institutional factors such as public and private regulation, the presence of NGOs and other independent organizations that monitor behavior, associative behavior among corporations themselves, and organized dialogues among corporations and their stakeholders.

The adoption of socially responsible behavior by a company depends on the country in which it operates. Companies tend to act with social responsibility as long as the normative institutions or cultures in a place create an adequate set of incentives to adopt the socially responsible behavior.

The way organizations relate to stakeholders depends on the set of institutions that surround them (Campbell 2007). This set of economic and political institutions affect and legitimize

organizational behavior through forces and pressures that act at the level of the external environment – at the macroeconomic/political level and at the organizational level – where organizations interact (DiMaggio and Powell 1983; Dillard et al. 2004; Campbell 2007).

The institutional environments take into account institutions (culture, regulation, and social norms) which influence and which are influenced by actors' interactions in a governance system (Muthuri and Gilbert 2011).

Institutions are social constructs defined as the set of cognitive, normative, and regulatory structures – understood as valid, appropriate, legitimate, and socially accepted – existing in the social environment where organizations operate (Meyer and Rowan 1977).

Some authors argue that the development of socially responsible behaviors through involvement in social projects (Margolis et al. 2007) improves the relationship with the main stakeholder groups (Freeman 1984).

Previous empirical studies have found that firms with better relationships with workers in countries with more competition, more robust legal enforcement mechanisms, better self-regulation of the sector, higher quality of management schools, and better macroeconomic environments act in a more socially responsible way (Chih et al. 2010).

According to Scott (1995), all organizations are socially constructed and therefore subject to institutional processes that shape the way they should assume and how they should behave and legitimize.

On the other hand, institutionalization “is the process whereby the practices expected in various social settings are developed and learned” (Dillard et al. 2004: 508).

According to Martinez and Dacin (1999), institutional theory focuses on the interaction between organizations and their institutional environment, on the effects of social pressures on organizations, and on the incorporation of these social expectations into organizational practices, procedures, and characteristics. Consequently, through an institutionalization process, organizations adopt positions, policies,

programs, and procedures and incorporate, internalize, and adopt values, norms, and organizational structures considered appropriate, rational, and socially valid, in order to legitimize their organization in the environment where it operates (Meyer and Rowan 1977).

Institutions have power and pressure organizations to seek the stability and conformity of their social behavior through processes of institutional isomorphism – coercive, normative, and mimetic (DiMaggio and Powell 1983). However, for Oliver (1991), organizations are not passive entities and respond strategically to the demands of the institutional environment, taking into account their personal interests.

Campbell (2007) admits that the various institutional pressures may be downward, but also admits behaviors of organizational resistance and proactivity to change the institutional status quo as a function of personal agendas (Oliver 1991; Dillard et al. 2004).

Several authors (Maxwell et al. 2000) identified positive contributions in the adoption of socially responsible behaviors in companies such as the following: avoid negative reactions from interest groups; reduce risks in regulatory threats; offer guarantees in financial institutions and insurance companies; reduce sanctions; and avoid legal demands. In other words, “non-conformity is usually punished, be it through the legal system or through social mechanisms such as boycotts; punishment is costly for firms, which implies that firms have an incentive to conform, or at least not to be seen as exceptionally deviant” (Witt and Miska 2019: 8).

However, “if today's CSR is associated with sustainability, its origins lie in defensive measures intended to respond to the societal criticism expressed by various social groups in face of the companies' economic and social “irresponsibilities” (Lamarche and Bodet 2018: 157). In fact, CSR legitimizes the activities of the company in the eyes of society and creates value for companies and for society and can also represent the image of excellence in both the internal and external environment (Gholami 2011).

In summary, institutions have been neglected in the current literature on CSR, which has

focused more on CSR outcomes than on its determinants (Jackson and Apostolakou 2010). Academic literature of institutional theory understands that the phenomena related to CSR are a fairly recent development (Brammer et al. 2012).

According to Brammer et al. (2012: 21), “the fact that CSR is ‘voluntary’ is less a defining feature of business–society relations and more a reflection of the institutional context of its initial inception.”

CSR does not work in an empty social context; CSR practices are “more likely to be adopted and become effective as they are incorporated into specific sets of institutions” (Jackson and Apostolakou 2010: 387). Hence, the institutional theory offers an extraordinary lens to understand and explain how and why CSR takes different forms in different countries (Brammer et al. 2012).

Summary

It is important to understand if there exists an institutionalized environment in the development of socially responsible practices and also to what extent the search for legitimacy is configured as the main motivation when it comes to adopting socially responsible practices.

CSR literature could focus on the level of explicit CSR – that is, the voluntary behavior of firms that goes beyond legal and societal expectations and produces social benefits.

New studies should explore the institutional perspective of voluntary forms of CSR, exploring the coevolution of CSR with institutional norms.

Synonyms

CSR advertisements; CSR communications; Social responsibility disclosure

Definition

Corporate social disclosure is defined by Gray et al. (1987, p. ix) as:

... the process of communicating the social and environmental effects of organizations' economic actions to particular interest groups within society and to society at large.

In other words, “social and environmental disclosure can typically be thought of as comprising information relating to a corporation’s activities, aspirations and public image with regard to environmental, community, employee and consumer issues” (Gray et al. 2001: 329) and can include also, among other things, disclosures of information about the interaction of an organisation with its physical and social environment, energy, and product safety (Mathews 1993).

Companies face growing expectations from stakeholders engaging in social responsibility, and, consequently, they are expected to communicate corporate social responsibility (CSR) efforts (Beckmann et al. 2006).

The term *CSR advertisement* is not widely used and by definition means disclosing a “social instance” (Farache and Perks 2010: 235) and “represents an approved, formalised and official perspective on CSR within the corporation” (ibid), providing information about “a company’s commitment to environmental concerns, community

relations or the future of mankind, without any overt attempt to promote a specific product” (Schroder 1997: 277). On the other hand, CSR communication remains an “emerging field in academia, with research focusing on corporate social disclosure mainly through websites and corporate reports” (Farache and Perks 2010: 235).

The academic literature reveals different theoretical approaches to explaining the motivation and extent of corporate social disclosure. However, legitimacy theory and stakeholder theory become the dominant conceptual approaches in the literature on disclosure, being that legitimacy theory is widely used to explain social and environmental disclosure by corporations, focusing mainly on corporate social and environmental reports.

The literature examines numerous factors that can influence the social disclosure of companies, among others, the dimension, profitability, the indebtedness, the age of the company, the cultural and institutional context of the country, differences in governance systems, the type of industry, media visibility and social performance, the ownership structure, and the multiple quotation on the stock exchange. These factors are considered significant determinants to explain CSR disclosure level.

In addition to these factors, the nature and extent of corporate social disclosure seem to vary across countries (Gray et al. 1996). However, the difference in the level of disclosure of non-financial aspects may be the result of government policies, such as in European countries, in Sweden, France, Norway, the Netherlands, and Denmark, where environmental legislation has been introduced with a view to environmental disclosure in companies (Douglas et al. 2004).

In this sense, Douglas et al. (2004) argue that firms domiciled in a more developed country are likely to disclose more voluntary information than companies operating in less developed countries. Adams (1999) explains the differences between countries, highlighting the importance of environmental and ethical impacts on industry and political issues that have an impact on ethical behavior. Thus, there is a link between the political and economic context and the nature of social disclosure (Arnold and Hammond 1994; Hogner 1982),

or cultural context and disclosure (Adams and Kuasirikun 2000).

According to Fukukawa and Moon (2004: 48), there is a reason to expect companies’ communication about CSR to be directly aligned with their practice in light of issues about ethics, reporting, transparency, and accountability being “part and parcel of CSR.”

CSR disclosure (CSR D) is especially “important in reinforcing the effects of CSR on corporate reputation” (Branco and Rodrigues 2008a: 687) and “can be a sign of improvement in environmental and social behavior and, therefore, of reputation in these domains, because disclosure influences external perception of reputation” (ibid.). In adverse economic periods, companies need to disclose CSR information and convince their stakeholders that their activities are in line with their social values, and as investors are more concerned about corporate performance, social disclosure can be used to minimize such concerns (Mia and Al Mamun 2011).

Therefore, the purpose of social reporting is to protect the reputation of the company, as they use corporate social disclosure as a communication tool, with the main objective of influencing the image and reputation of companies to stakeholders (Hooghiemstra 2000).

Thus, academic studies suggest that reputation issues are an important factor in explaining the CSR D motivation since CSR reports are seen as a marketing tool (Thomson and Jain 2010). To that extent, CSR reports have become one of the main communication tools through which companies promote their stakeholders’ sustainability and socially responsible operations (Golob and Bartlett 2007). Although it does indicate that some companies use CSR disclosures as a tool to improve their corporate image during times of low confidence of the entrepreneurs, CSR disclosures are also used to generate trust among its stakeholders because they are essential for the company success.

Introduction

The communications process is “one of the key points in the dissemination of a CSR culture in the companies” (Lamarche and Bodet 2018: 157).

According to this authors, two explanations are invoked: “1) CSR remains a communications approach and therefore does not limit the companies’ financial performances; and 2) CSR permits an increase in the value of its intangible assets by strengthening its property rights or producing concrete proofs in response to ecological criticism” (Lamarche and Bodet 2018: 167).

According to the Communication from the European Commission, “disclosure of social and environmental information, including climate-related information, can facilitate engagement with stakeholders and the identification of material sustainability risks; is also an important element of accountability and can contribute to building public trust in enterprises” (European Commission 2011: 11).

There are different theoretical approaches to explain the motivation and extent of corporate social communication (Piatti 2014). In fact, several studies present the motivations underlying social disclosure: the agency theory (Jensen and Meckling 1976), stakeholder theory (Tilt 1994), theory of legitimacy (Guthrie and Parker 1990), institutional theory (Campbell 2007), theory of significance (Ross 1977), theory of property costs (Dye 1985), theory of contingency (Doupnik and Salter 1995), and economic policy theory (Guthrie and Parker 1990). However, legitimacy theory dominates the explanations of socio-environmental disclosures by focusing on the process of legitimization and the role of social disclosure in legitimacy strategies (Lindblom 1993). Thus, the study of voluntary social disclosures made by companies is based on legitimacy theory (Tilling and Tilt 2010).

According to Suchman (1995: 574), *legitimacy* “is a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions.” That is, legitimacy theory “posits that organisations continually seek to ensure that they operate within the bounds and norms of their respective societies” (Brown and Deegan 1998: 22).

The literature examines numerous factors that may influence corporate social disclosure being considered significant factors to explain the level of CSR disclosure, including size (Hackston and Milne 1996), profitability (Bowman 1978), the

indebtedness (Salamon and Dhaliwal 1980), the age of the company (Roberts 1992), the existence of a social responsibility body within the company (Cowen et al. 1987), the cultural and institutional context of the country (Gray et al. 1987), differences in governance systems (Aguilera and Cuervo-Cazurra 2004), the type of industry (Sweeney and Coughlan 2008), media visibility and social performance (Brammer and Pavelin 2004), the ownership structure, and the multiple listing on the stock exchange (Kiliç 2016).

Brammer and Pavelin (2004) observed a highly significant positive correlation between voluntary disclosure and corporate social performance. Adams (2002) examined some of the internal organizational factors that can influence media and ethics. The study revealed that the country of origin, the size of the companies, and the corporate culture were factors that influenced the decision-making process, regarding the publication of social disclosure. In fact, it is generally accepted that large companies advertise more than smaller firms (Patten 1991).

In fact, larger companies tend to be more visible to the relevant public (Brammer and Pavelin 2008), because “as the company becomes bigger, the number of stakeholders involved will also increase and with this increase, the burden of disclosure becomes heavier for the company since it has to cater to the needs of a bigger group of people” (Amran et al. 2008: 45).

According to Lopes and Rodrigues (2007), since disclosure is a complex function of several factors, economic issues cannot be studied in isolation from the institutional, political, and social framework from which the economic activity of any entity operates.

Academic studies suggest that reputation issues are an important factor in explaining the CSR motivation since CSR reports are seen as a marketing tool (Thomson and Jain 2010). In this sense, some authors argue that the purpose of social reporting is to protect the company’s reputation as it uses corporate social disclosure as a communication tool, with the main objective of influencing corporate image and reputation vis-à-vis stakeholders (Hooghiemstra 2000). Thus, the report allows formal compliance by the company with its various stakeholders and its conformity with

the production and distribution of charges and values (Gray et al. 1996), since CSR reports are viewed as a marketing tool to stakeholders, which are fundamental to “business success and survival” (Mia and Al Mamun 2011: 176).

In fact, “the major perception of CSR is that it can be an excellent tool for enhancing the legitimacy of the firm among its stakeholders and the development of a positive corporate image” (Morimoto et al. 2005: 318).

Mia and Al Mamun (2011) stated that companies need to disseminate information to legitimize their activities and meet the demands of various stakeholders, regardless of economic circumstances. The level of legitimacy is likely to vary between companies given that companies that are more visible to their stakeholders require a greater level of legitimacy (Branco and Rodrigues 2008a).

When a company’s legitimacy is claimed, threatened, or damaged, strategies must be developed to repair legitimacy (Suchman 1995).

According to Bebbington et al. (2008), legitimacy theory proposes that there are four ways in which an organization can obtain, repair, or maintain legitimacy if the “social contract” between itself and society is damaged. In this regard, Lindblom (1993) describes different strategies:

- i. To correct the behavior of their organization realigning it with the desires of society.
- ii. To change the perception that society has of their behavior, but not the behavior itself.
- iii. To transform the perception that society has of their behavior, manipulating it, deceiving it, or simply distracting its attention.
- iv. To indoctrinate society with the aim of modifying its expectations and accommodate them to the organization’s ends (Lindblom 1993: 13–17).

In summary, a company’s performance is legitimate when it is evaluated that it is fair and deserving of support, that is, when it is socially acceptable. Legitimacy, therefore, requires that reputation is maintained. In this perspective, in adverse economic periods, companies need to disclose information

and convince their stakeholders that their activities are congruent with their social values (Mia and Al Mamun 2011) because the disclosure of social and environmental information can be seen as an instrument to legitimize the company’s activity (Branco et al. 2008).

The studies on the explanatory factors of the motivations to disseminate information about CSR focus essentially on the study of how organizational internal factors influence CSR reporting policies, such as size, profitability, indebtedness, the sector of activity, the country of origin, the attitude of the executive directors, the age of the company, and the existence of social responsibility commissions (Douglas et al. 2004).

Literature shows a series of studies that have been carried out to examine the level of social disclosure and its categories in the annual reports and respective corporate websites in different countries, having concluded that the most important categories are *resources humans*, *involvement community*, *environment*, and *product* (El-Bannany 2007). In this sense, McMurtrie (2005) also argues that the issues that society considers important involve five major themes, and the ones most used in most corporate social disclosure surveys are *environment*, *energy*, *human resources management*, related issues with *products*, and interaction with the *community*.

The environmental and social information disclosure about which company activities may impact is typically voluntary (Gray et al. 2001). These authors distinguish between *voluntary disclosure* and *mandatory disclosure*: *mandatory disclosure*, “meaning that required by law or code of practice” (Gray et al. 2001: 332), and *voluntary disclosure* “refers to both disclosure in non-mandatory areas (e.g., in the UK, environmental or equal opportunity disclosures) and disclosure which, whilst relating to a mandated area (e.g., in the UK, numbers of employees) goes beyond the minimum disclosure required by rules” (Gray et al. 2001: 351).

The issue of CSR disclosure being voluntary versus mandatory has long been debated (Jain et al. 2015). Those who advocate voluntary disclosure point to “the increase in CSR reporting in the past decade, arguing that for a variety of

reason, firms have an incentive to disclose social and environmental behaviours without compulsion; the counter-argument questions the quality of such disclosures” (Jain et al. 2015: 3).

As to the motivations for voluntary social disclosure, Brammer and Pavelin (2004) advocate that it reduces information asymmetries between companies and external stakeholders, especially community investment, in relation to corporate policies and performance. However, social disclosure “may be only the formal fulfilment of certain requirements, and it may be used as a mere marketing strategy, which negates its deeper meaning” (Piatti 2014: 11) since not being mandatory, each company discloses the information that is most convenient to them.

The literature on CSR has concluded both on the gradual increase in the number of companies that adopt CSR practices and on the gradual increase of the information provided on CSR (Aşıcı and Bünül 2012, Gray et al. 2001, Hassan and Ibrahim 2012, KPMG 2013a, 2015, 2017). However, there are important differences in the relevance and quality of the published information (Prado-Lorenzo and Garcia-Sanchez 2010). As stated by the KPMG Survey of Corporate Responsibility Reporting 2017, “Governments, regulators and stock exchanges continue to play a key role in driving up CR reporting rates around the world” (KPMG 2017: 15).

In fact, according to KPMG (2017), in the three countries which have experienced the greatest increases in reporting since 2015 – Mexico, New Zealand, and Taiwan – a mix of new regulation, stock exchange requirements, and investor pressure have been instrumental increasing reporting. This study (KPMG 2017) shows that CSR reporting has also increased in the United Arab Emirates (UAE) since 2015.

Another important explanation for the strong growth in CR reporting in non-financial disclosure across a number of European Union (EU) countries could be the fact that it is possible that awareness of the EU Non-financial Reporting Directive has helped to boost reporting rates in some EU countries. The Directive is a key step toward increasing the importance of CR reporting, particularly in those

Member States where no such requirements previously existed.

In fact, under the Directive, companies that do not disclose their social, environmental, and Board diversity policies can be named publicly. So, this risk of reputational damage may already have convinced some non-reporters to start reporting with more expected to follow suit (KPMG 2017).

The EU Non-financial Reporting Directive – which requires large companies in the EU to disclose social, environmental, and diversity information – is the most significant legislative initiative across the EU to promote corporate responsibility reporting. But the real impact of the Directive will begin to be evident in 2019 or 2020 after these delays in transposition and in a transitional period as companies become more familiar with legislation and introduce new internal communication systems or adapt existing ones (KPMG 2017).

However, “many businesses in Eastern Europe are still focused on the financial bottom line rather than the triple bottom line – it’s fair to say that a culture of sustainability is yet to properly take hold across the region” (KPMG 2017: 15).

The proliferation of regulations requiring mandatory CSR disclosure is relatively recent. Table 1 shows a listing of the regulations issued by various countries in this regard.

As we can observe, there is a continued and growing interest in regulation, including corporate governance and disclosure requirements. But as stated by Olivier – Chief Executive, Accountancy Europe – (KPMG 2017: 12) “reporting is only an instrument; the benefits will come once CR objectives and practices are fully embedded in the business, which reporting can demonstrate but cannot achieve on its own.”

Summary

From the historical point of view, the new regulation has come out of crises or emerging issues. The future of CSR reporting will tend to evolve to fit new issues and drive the quality of implementation of existing issues.

Increasingly specific requirements will be necessary to facilitate implementation of economic instruments such as trading schemes or carbon taxes, compelling companies to disclose more reliable and accurate information. For example, for requirements for more sophisticated disclosure related to tax evasion, a country-by-country breakdown of tax payments will be fundamental.

Regarding emerging markets, there is particular interest in socioeconomic impact, which will drive further disclosure regulation around impact assessment and valuation. Investors understand the business logic that underlines the concept of treating environmental, social, and governance issues as material. But many companies fail to report business logic, true value creation, and materiality effectively. Some leading stock exchanges, notably from emerging markets, are starting to mandate disclosure that requires not only reporting numbers but also a better description of the business logic and sustainability behind the numbers.

Green Tourism

Definition

The identification of a clear definition about the concept of corporate social responsibility in the tourism sector (TS) is complex due to the coexistence of different expectative from stakeholders regarding the firm's activities (Waligo et al. 2013). In this sense, nowadays, academics have not yet provided a clear definition of this phenomenon. However, the increasing number of nonfinancial reports yearly disclosed by firms that operate in the tourism and hospitality sector (KPMG 2017) could represent an effective driver for academics to extend this field of study.

One of the prior strategies adopted by policymakers about socially responsible practices in the tourism sector is represented by the Global Code of Ethics for Tourism (Fennell 2014) proposed by United Nations Tourism World Organization (UNWTO). The code follows the prior contribution collected on the Manila Declarations of 1980 on world tourism and of 1997 on the social impact of tourism, as well as on the Tourism Bill of Rights and the Tourist Code adopted at Sofia in 1985 under the aegis of WTO. Moreover, the code is composed of nine articles with several commas in order to describe in a more detailed way the principles that inspired the document. Nowadays, UNWTO has introduced further documents in order to extend part of the worldwide strategies on sustainable development to the tourism and hospitality sector. One of the most important contributions provided by UNWTO (2017) is represented by the proposal of a strong connection between tourism sectors and the 17 Sustainable Development Goals (SDGs).

Tourism and Sustainable Development

The complexity of the sector is related to its intrinsic characteristics that impact severely on firms' strategic planning. Specifically, the tourism and hospitality sector is a typical multistakeholder context where actors such as communities and incoming tourists present different expectative about firms' activities due to their different

perceptions about them. In this sense, firms inspired by ethical principle must identify strategies adequate to the expectative in order to satisfy the different categories of stakeholders' interests directly or indirectly from firms' activities. Furthermore, this evidence impacts on firm's measurement of socially responsible strategies. In fact, the sector's multistakeholder character needs the provisions of KPI adequate to describe the specific impacts of each activity on stakeholders. Specifically, problems such as pollution or human rights are perceived differently from stakeholders like local communities or consumers due to their different perceptions about firms' behaviors.

Moreover, from a strategical point of view, the complexity of the theme is not related only to firms' activities but also to the communication tools adopted by them due to the different stakeholders' backgrounds. In this sense, the identification of effective communication tools by firms represents a relevant strategic choice to engage with the designed stakeholders (Toelkes 2018). Specifically, a large part of them adopted strategic tools to disclose their nonfinancial performance such as reports and dedicated sections on their website. In this sense, the typical voluntarily character that characterized their CSR's communication improves the degree of heterogeneity of these kinds of information due the absence of consolidated framework and by the absence of institutional pressures made by third institutions such as regulators, think tanks, and NGOs.

According to this evidence, the comprehension of SE activities made by TS' firms represents a specific and not yet well-explored field of study due the intrinsic peculiarities that characterize the sector. In fact, according to prior studies, the CSR's communication is influenced typically by several factors such as firm size and culture of origin (Fifka and Drabble 2012). In this sense, the specific peculiarities of TS increase these criticisms due the existence of situations characterized by divergences between firms' size and profitability (Lansing and De Vries 2007) and firms' geographical position and owners' country of origin (Falk and Katz-Gerro 2016).

CSR in Tourism

Globalization has impacted severely on consumers' preferences in the tourism and hospitality sector (Zhang and Khare 2009). In fact, the last few years have been characterized by new tourists' exigences about their travel experience. Part of these new exigences could be reconducted to some aspects that characterize firms that operate in socially responsible ways. In this sense, a large part of tourism and hospitality firms adopted new strategies in order to interact in an effective way with these new consumers. Specifically, the current scenario is characterized by the introduction of new products and by the adoption of new strategies related to corporate social responsibility paradigms.

An example of tourism's product characterized by a strong relationship with socially responsible practices is represented by "Green Tourism." The market share related to Green Tourism has been characterized by an increasing growth caused by the progressive attention paid by tourists to ethical and sustainable aspects related to products and services offered by tourism firms. In this sense, in order to assure the reliability of the information provided by firms, the last years have been characterized by a progressive diffusion of ethical labels in order to certify them (Lebe and Vrecko 2015). However, about the role of labeling on tourism's social responsibility, some authors denoted skepticism due the possible use of impression management and greenwashing practices (Self et al. 2010). Moreover, the concept of Green Tourism could be extended to the destination. In fact, as evidenced in prior study, the degree of sustainable development characterizes a destination impact on tourists' preferences. In fact, prior studies denoted how the identification of a travel destination is influenced both by the offers and by its geographical localization (Baloglu and Mangaloglu 2001). Moreover, further studies denoted how the presence of negative externalities like pollution in areas not far from the destination impacts negatively on tourist's perception even if in absence of direct connections (Xu and Reed 2017).

Furthermore, as evidenced before, the adoption of socially responsible practices represents an effective strategy to increase the attractiveness of a destination for a specific group of consumers. A typical case study related to corporate social responsibility in tourism and hospitality is represented by the positive effects on ethnocentrism's phenomenon. Specifically, consumer ethnocentrism consists of the preferences to buy goods or services from the country perceived similar in characteristics to their country of origin (Shimp and Sharma 1987; Balabanis and Siamagka 2017). The comprehension of ethnocentrism represents a strategic driver for firms that would operate in foreign countries or foreign consumers. In this sense, this evidence is typically connected to sectors such as tourism and hospitality where tourists obviously come from other contexts (Kock et al. 2019). In this sense, engaging in an effective way with tourists that come from other countries represents an opportunity for firms that would increase their revenue through the interaction with new market segments.

According to this evidence, a way to reduce skepticisms or to increase firms' market share through the interaction with new categories of consumers is represented by the adoption of behaviors inspired by the paradigm of corporate social responsibility. In this sense, in order to share with stakeholders, the socially responsible practices adopted, a central role is covered by stakeholder engagement strategies (Stokes 2008; Tompkins et al. 2008; Herrera et al. 2018). In particular, in the tourism and hospitality sector, stakeholder engagement represents a typical tool to increase the social legitimacy of entities. In fact, as evidenced before, tourism social responsibility represents a complex field of studies because its comprehension needs the analysis of the impacts connected to categories of stakeholders typically less interested in firms' activities. Specifically, in tourism, a central role is covered by the local community because they in certain cases reject the presence of foreign firms that operate in their land as tourism enterprises (Khazaei et al. 2017). However, nowadays, only few studies have analyzed the peculiarities of foreign direct

investments in the tourism sector (Connelly et al. 2011). Moreover, academics denoted how the adoption of stakeholder engagement practices in order to improve the degree of acceptance by local community needs a specific analysis in order to adapt the communication to the effective exigences of stakeholders interested by firm presence (Dal Maso et al. 2017). In this sense, prior studies denoted how the reactions to nonfinancial reporting (Lock and Seele 2016; Diouf and Boiral 2017) and web reporting (Chapple and Moon 2005; Wanderley et al. 2008; Santos et al. 2016) in order to engage with stakeholders are influenced by countries of origin and cultural backgrounds.

Key Issues

As evidenced in prior sections, tourism social responsibility represents a stand-alone topic in corporate social responsibility due to its peculiarities. In fact, the coexistence of different expectative about firms' activities and the possible divergence between interests represents a complex phenomenon that needs specific analysis. In this sense, a central role will be covered by managers and policymakers in order to identify new operational paradigms that satisfy the different interests about social responsibility practices.

From a managerial point of view, firms will identify new tools in order to engage in a more effective way with their stakeholder. Specifically, as evidenced before, this activity needs the preliminary comprehension of firms' audience to clearly identify the real expectative about firms' social responsibility.

From a policymaker's point of view, tourism and hospitality remains a sector characterized by the absence of specific regulations about CSR. In this sense, the increasing attention paid to this topic by new categories of tourists and the large investment paid by firms to achieve green label introduce a new exigence for them.

Finally, from an academic point of view, CSR in tourism represents a not well-explored research area. In this sense, a limit for in-depth analysis is represented by the characteristics of this sector

that is typically composed by SMEs. However, according to prior studies about SMEs' CSR, academics will introduce new research in order to extend the knowledge on this topic and to promote the adoption of these practices.

Summary

As evidenced by Bebbington and Unerman (2018), the achievement of SDGs will be favored by the active contribution of the private sector. According to this evidence, the tourism and hospitality sector must continue to support and favor the adoption by firms of nonfinancial reports in order to promote their contribution to SDGs. However, the absence of a clear and largely adopted definition of corporate social responsibility in the tourism and hospitality sector represents a new challenge for academics in order to fill this gap through the identification of new paradigms. Moreover, the coexistence of different stakeholders' expectative about firms' activities suggests how the identification of a single definition is not possible. In this sense, future research will introduce in management studies new topics about the different concepts of sustainability that could be reconducted to the tourism sector.

Synonyms

Corporate citizenship; Corporate strategy; CSR strategy; Corporate responsibility (CR); Sustainability strategies

Definition

Scholars and academics agree that the book *Social Responsibilities of the Businessman* by Howard R. Bowen (1953) is the authentic definition of the phrase social responsibility. Ever since, the business community and modern literature have developed and discussed the concept using phrases like social responsibility, corporate responsibility, corporate citizenship, corporate strategy, sustainability strategies, etc. The idea has developed dynamically and quickly, philanthropic era, awareness era, issues era, and responsiveness era (Murphy 1978), and it wasn't until the 1990s that CSR began to emphasize ethics and sustainability (Carroll 2009).

The advancing development of corporate social responsibility (CSR) by the business community, scholars, and sustainability experts in the battle of the concept of CSR remains indefinite, wide, and ambiguous and is open to a multitude of interpretations (Preuss 2013). The effort to develop a concrete concept and definition of CSR is progressing toward the standardized social responsibility by ISO 26000 and reporting it through the standards provided by Global Reporting Initiatives (GRI 2016).

CSR strategy is described as the comprehensive cycle of planning, implementing, monitoring, assessing, and reporting of corporations' approaches to resolving social and environmental concerns, taking into consideration the most recent and potential evolution of the concept.

Strategies should be voluntarily included in a company's interaction with its stakeholders (CEC 2001, p. 6). The whole cycle has a long-term outlook, significant resource commitments, and, on occasion, significant structural changes (Bansal et al. 2015). It should be integrated into business organizations' core competencies and incorporated into various levels of the organization's strategy (Preuss 2013).

Introduction

After 1950, the idea of corporate social responsibility (CSR) was firmly established (Carroll 2009). Therefore, throughout the Industrial Revolution in the 1800s, CSR practices have begun to emerge. Companies' factory system in Great Britain and America has been blamed for several other social issues, including women's and child labor, as well as poverty. Companies began to be cautious regarding their employees' health and their productivity. Concerns about employees prompted philanthropy, although the distinction between an individual and business philanthropy was muddled at the time. The "community chest movement" helped define business philanthropy from 1918 to 1929 and is recognized as the first kind of philanthropy. Between 1920 and 1930, a period that is considered as "trusteeship management" took place. Corporate managers were in charge of maximizing stockholder wealth and establishing and maintaining a fair balance between customers, employees, and communities at this period. Companies began to be considered as institutions with a responsibility to meet societal obligations from the 1930s to the present (Agudelo et al. 2019).

The fact that companies donated gas to charities above all during the "philanthropic" era, which happened in the 1950s, led to an era of "awareness" from 1953 to 1967, where corporate responsibility in the community was highly valued. Companies had begun to focus on certain problems that were then deemed as "issues" era, such as racial discrimination and pollution, until roughly 1968–1973. Companies began adopting major management and organizational initiatives

to intervene in CSR concerns in the 1970s. Scholars began to develop the formal meaning of CSR in the 1960s as a result of its rapid rise. Issues including charity or philanthropy, employee welfare, and customer relationships were incorporated into business practices defined as social responsibility toward the end of the 1960s (Carroll 2009).

Many researchers recognized the relevance of a management approach to CSR in the 1970s (Carroll 2009), leading to recommendations for corporations to predict, plan, coordinate CSR, measure social performance, and institutionalize corporate social policy and strategy. Companies were therefore forced to build organizational procedures to comply with federal legislation in the areas of the environment, product safety, workplace discrimination, and occupational safety under the legislative initiative. Scholars developed related topics and themes of CSR, such as corporate social response, public policy, business ethics, and stakeholder theory/management, through research in the 1980s, which also overhauled CSR's concerns in relation to those issues and themes.

The 1980s was a time when ethical crises dominated the news, drawing public attention to corporate misconduct. A childhood scandal that lasted most of the 1970s and half of the 1980s, a corporate scandal that killed thousands of people in 1984, the Union Carbide Bhopal explosion in India, and a business in South Africa, Apartheid, and the Ivan Boesky insider trading scandal in the mid-1980s are all examples of these scandals (Carroll 2009). These scandals, which have been viewed as examples of corporate greed, have prompted the rise of alternative CSR issues such as stakeholder theory and business ethics.

Significant advancements in the field of business practice occurred throughout the 1990s. This milestone was celebrated by the establishment of Business for Social Responsibility (BSR), a non-profit organization that represents initiatives and professionals concerned with CSR. Community investment, environment, governance and accountability, marketplace, human rights, and workplace and business ethics were all included in BSR's definition of CSR (Carroll 2009).

The search for the truth about CSR lasted into the 2000s when an empirical study on themes like stakeholder theory, business ethics, sustainability, and corporate citizenship emerged. Through empirical research relating CSR or CSP to other relevant variables, new CSR concepts dominated the decade 2001–2002. The researchers discovered that job seekers consider corporate social performance (CSP) when evaluating potential organizations or corporations and that major characteristics of CSP include the environment, community relations, employee relations, diversity, and product concerns. CSR continued to rise in the 2000s, most especially in the European business community, and eventually became a global phenomenon (Carroll 2009).

Corporations have recognized CSR not just as a good deed based on a moral obligation to society but also as a business gain. Changes in the environment, particularly in the context of globalization and the internal market, have become a challenge for businesses, and this is where CSR may provide direct economic values. Companies can contribute to social and environmental goals by incorporating CSR as a strategic investment into their core business strategy, management, and operations, in addition to producing profits.

The shareholder strategy, the altruistic strategy, the reciprocal strategy, and the citizenship strategy are the four CSR strategic options proposed by Galbreath (2006) for business companies. According to Galbreath (2006), CSR is viewed as a component of an overall profit motivation that is only focused on increasing shareholder returns in shareholder strategy. When the entangled relationship between a company and the community is recognized and appreciated, it is referred to as an altruistic strategy. The reciprocal strategy is based on companies' becoming proactive in terms of social responsibility. Finally, a component of citizenship strategy is that it recognizes that stakeholders are diverse and each has different interests and expectations, and it balances the competing demands of the numerous groups that have an interest or are affected by the organization (Table 1).

There are four elements that could enable CSR to be more effectively handled in order to integrate

Corporate Social Responsibility Strategy, Table 1 CSR strategic options for business companies (Galbreath 2006)

	Shareholder strategy	Altruistic strategy	Reciprocal strategy	Citizenship strategy
Goal	Profit	Give back	Mutual benefits	Responsibility; transparency; sustainability; accountability
Vehicles	Rationalization/self-interest	“Checkbook” philanthropy	Public relations; sponsorships; partnerships; community activity; volunteering; cause-related marketing	Governance; applied ethics; stakeholders dialogue; input to/outflow of corporate strategy
Measurement	Financial results	Donations	Activity-based reporting	Triple bottom line; holistic
Benefactors	Shareholders/others indirect	Community groups and causes	The firm and the community	To firm: survival position, role; to partners of all sectors; to wider society
Benefits	Financial	May not be measured	Performance, market goals; human resources	Tangible plus potentially intangible
Timeframe	Short-term vision	Intermittent: possibly timed (e.g., annually)	Medium- to long-term planning	Long-term horizon

it strategically into a company's business strategy: (1) firm mission, (2) strategic issues, (3) markets, (4) consumer needs, (5) resources, and (6) competitive advantage (Galbreath 2009). CSR strategy must consider the expectations of certain stakeholders, the industry, and other levels of competition, as well as the company's mission or goals. The right reflection and knowledge of the environment and its impacts on the organization is in the domain of strategy once CSR has been integrated into the company's objectives. Social factors must also be considered when deciding which part of the market to select the target. In CSR strategy, market orientation and innovation are two crucial components in establishing customer needs. The ability to define the context of a CSR strategy by demonstrating how much resources are utilized to internalize some of the company's unique benefits is critical. In order to build and sustain competitive advantage, a company can consider how to incorporate social responsibility into strategy by understanding and addressing issues that have hampered its ability to achieve its mission of creating products/services that meet market needs through effective resource composition.

Companies' increasing efforts and commitment to design and implement CSR strategies have a widening of strategic challenges and a challenge on the sustainability of CSR efforts and impact; therefore, corporations are looking for a more defined method and framework to work with. Adopted by the UN as a development agenda since 2015, the SDG framework consists of 17 goals and 169 implementation strategies. Through the convergence of numerous tactics, the SDGs as a whole continue to work on the unfinished Millennium Development Goal (MDG) agenda, expand, and address new problems. The goals highlight the situation of poverty, sustainable development, and environmental, as well as the necessity for excellent global governance and partnerships to achieve these objectives (Lingham 2017).

Key Issues

Social responsibility and social issues are two variables that must be understood in order to comprehend strategic CSR. What society expects of a company is referred to as social responsibility,

and social issues are the variables that connect to the given responsibilities. These factors can have an impact on a company's capacity to meet its objectives as well as its social obligations. According to scholars, there are two types of social contracts: "formal," which refers to a company's explicit obligations such as following rules and regulations, creating jobs, paying taxes, etc., and "semiformal," which refers to society's implicit expectations of the company. Observance to global labor and environmental standards (e.g., SA 8000, AA 1000, ISO 14031) that are not required by law, triple bottom-line reporting, adhering to industry norms and codes of conduct, fulfilling brand promises, and contributing philanthropically to the community are among the implicit expectations of society for businesses (Galbreath 2009).

CSR has primarily been advocated by multinational corporations up to this point. It is, nonetheless, applicable to be implemented in all kinds of companies and activity sectors, from small and medium enterprises (SMEs) to MEs to multinational enterprises (MNEs). Many SMEs have demonstrated this by engaging in community involvement, creating awareness, and assisting in the dissemination of best practices. SMEs, including microbusinesses, are the largest employers and contributors to the economy.

Various global standards also have arisen in the business and development arenas to assist these enterprises in implementing CSR. There are currently over 400 various standards, principles, and codes of conduct, according to the International Labor Office's business and social initiatives (BSI). Many organizations have recognized these standards, such as ISO (International Organization for Standardization) 14,000 and 14,031 for the environment; Social Accountability (SA) 8000 for labor-related issues; the United Nations (UN) Declaration on Human Rights and the Environment; the Caux and Sullivan Principles for economic, social, and political justice and general CSR; and the OECD (Organization for Economic Cooperation and Development) Guidelines for Multinational Enterprises for general CSR. Firms are under increasing pressure to strategically examine a set of external benchmarks as

they develop CSR policy, with these and many other worldwide standards encompassing all potential dimensions of social responsibility (Galbreath 2009).

The majority of these responsible practices have an impact on employees and are linked to concerns like human capital investment, health and safety, and change management, whereas environmentally responsible practices are mostly applied in the manufacturing process. It has to do with natural resource management. This has become a significant challenge for companies looking to hire and retain competent workers. Lifelong learning, employee empowerment, better information throughout the company, better balancing of work, family, and leisure, greater workforce diversity, equal wages and career prospects for women, profit sharing and share ownership schemes, and concern for employability and job security are all related measures in this context. Employees who are unable to work due to disability or accident have also been demonstrated to save money when given active guidance and management (European Commission 2001).

Another significant development in society today is the requirement for increased accountability. Environmental, human rights (including employment issues), and social justice movements all around the world have put pressure on companies to be competitive with their CSR strategies. The contributions of companies to social concerns are examined by society, and since the Internet's invention, it has expanded outside the town where the business is located. Companies are expected to share their experiences with the general public and to serve as role models for other businesses. CSR has emerged as a critical component of business-society relations, with the media serving as a facilitator in this process (Toker 2019).

Summary

Over the last few years, there has been a considerable increase in public awareness of sustainability. Due to the advancement of technology and media, the global crisis comprises of social and

environmental challenges that are extensively addressed on various levels and contexts, across layers of society and identities. The battle of the concept of CSR continues to be indefinite, wide, ambiguous, and open to a variety of interpretations by the business community, scholars, and sustainability experts (Preuss 2013).

CSR was not really established until after 1950, according to history. However, throughout the Industrial Revolution in the 1800s, practices that referred to CSR may begin to emerge. Companies' factory system in Great Britain and America has been criticized for several other societal issues, including women's and child labor, as well as poverty. Ever since, CSR concepts have evolved, and the search for what CSR genuinely means has continued to this day. From the "philanthropic era," when companies donated a portion of their profits to help the community until social responsibilities are seen not only as altruistic or social obligations but also as a way for the company to benefit from them, social responsibilities have become more strategic.

Galbreath (2006) proposed four CSR strategic options for business companies to better understand this development, which are the shareholder strategy, the altruistic strategy, the reciprocal strategy, and the citizenship strategy. He also suggested four aspects to help understand CSR: (1) firm mission, (2) strategic issues, (3) markets, (4) customer needs, (5) resources, and (6) competitive advantage (Galbreath 2009). Build a competitive advantage by understanding and addressing the issues that have affected the ability of the company to achieve its mission, so that products/services can be produced to meet the needs of the markets that the company serves through effective resource composition, in order to build and sustain competitive advantage, which can help the company to explore ways in which social responsibilities can be built into the strategy.

To counterbalance the development in strategic CSR, standards have been made available by several relevant institutions in the business and development scene, for example, ISO 14000 and 14,031 for the environment; SA 8000 for labor-

related issues; the UN Declaration on Human Rights and the Environment; the Caux and Sullivan Principles for economic, social, and political justice and general CSR; and the OECD Guidelines for Multinational Enterprises for voluntary principles and standards with respect to CSR. Finally, there is a framework called SDGs that addresses more relevant strategic issues that companies can integrate into their CSR strategies.

Due to raising awareness of society, accountability was demanded more than ever by society. Companies are expected to share them with the general public and set an example for other companies to follow their steps. Finally, to support the development of this area, better knowledge and further research on the impact of CSR on business are needed. This could be an area for further research among companies, governments, and academic institutions.

Definition/Description

Strategy is the main mechanism/outline through which an organization or individual seeks to attain its long-term targets or objectives, with accompanying defined guidelines or plans for achieving them, structured in a way that explains who is responsible for what, how the objectives will be achieved, and the tools required for attaining same.

Defining Strategy: Complex and Multifaceted

Several authors have proffered different definitions for strategic management, and despite the plethora of literature in strategy, there is no universally agreed definition. Indeed, even the broader study of strategy, i.e., strategic management, has been criticized by a Mintzberg (1987) as being unable to rely on a single definition of strategy. However, it is important to refer to one of the earliest definitions of strategy, which defines strategy as a process that deals with the outline of the entrepreneurial work of the organization, with organizational renewal and growth, and, more particularly, targeted at guiding the organization's operations (Hofer and Schendel 1978). This definition by Hofer and Schendel (1978) is not all encompassing but is only included here as one of the exemplars of the early definitions of strategy, seeing that it focuses on the concept as a “process,” i.e., a means to an end.

More recently, strategy has also been referred to as a “practice,” an approach which attempts to shift attention away from a mere focus on outcomes alone to a more comprehensive, in-depth analysis of what actually takes place while thinking and doing strategy (Golsorkhi et al. 2010). Having this process/practice divide in mind, a review of the chronological evolution of strategy definitions is provided in Table 1. The table explores different periods in the study of strategy, outlining how the definition of the concept has moved from its application in warfare to the current “practice” focus. Ten (10) definitions by

Corporate Strategy, Table 1 Perspectives of strategy across 30+ years

Author (year)	Strategy definition emphasis
Sun Tzu (320 B.C) in Giles (2013)	Focused on military strategy (Art of War), exploring strategic thinking for winning battles
Alfred Chandler (1962)	Explored the strategy-structure paradigm. Identifying strategy as the determination of long-term goals and adoption of courses of action for carrying out the same
Igor Ansoff (1965)	Investigated strategy within the context of incremental development of historical trends but argued that it cannot be used when dealing with surprises (unexpected events in external markets)
Hofer and Schendel (1978)	Conducted analysis of how firms should compete within a business environment and which business they should engage in
Porter (1980)	This study explores strategy from an industrial economics viewpoint, placing emphasis on industry analysis and the positioning of the firm within the industry
Mintzberg (1987)	Described strategy as a craft, using a striking image of the strategist making strategy as a potter crafts clay
Rumelt (1991)	Explained strategy as a reflection of the direction of an organization in competing for customers, resources, and revenue
De Wit and Meyer (1998)	Espoused strategy as process (operational), content, and context (based on the environment under consideration)
Hoskisson et al. (1999)	Outlined that strategic management involves pendulum-like swings, influenced by the firms' external environments and internal resources
Jarzabkowski (2005), Rouleau (2015)	Introduced the era of strategy-as-practice, which explores strategy as not being about investigating something that a firm has but what they do

seminal authors is provided, from which a synthesis is conducted to reach a conclusive definition.

From Table 1, different views of strategy are presented, showing how the research domain has evolved over the years. Within the body of knowledge, the current arguments are around whether strategy should be approached as a “process” or “practice.” The process approach examines how the content of strategy influences the overall outcomes (Van de Ven 1992). The interest of strategy process approach is to explore the dynamic relationships between the firm’s competitive position, resources, and eventual outcomes (Chenhall 2005). The process stream also explores how strategy is designed, who is involved, and how individual differences (of managers) affect the overall strategy. The practice approach, on the other hand, seeks to understand how the people shaping strategy and the activities involved influence the overall outcomes (Rouleau 2015). Thus, defining strategy may involve a messy interchange between the process and practice views; however, such arguments lie outside the scope of this work as the focus is to define strategy. The definition adopted in this study is not superior to previous attempts at defining strategy,

as it is nearly impossible to condense the concept into a single definition. Adopting multiple definitions only fosters confusion rather than clarity, hence the justification for providing this synthesized definition. The reason for creating this unifying definition is that it:

- Considers the complex organizational areas of the firm (Hitt 2006)
- Takes key components in the business environment into consideration (Kald et al. 2000)
- Recognizes that markets are not stable/static (Prahalad and Hamel 1994)
- Takes key stakeholders into consideration (Jarzabkowski 2005)
- Explores realistic premises and issues within the firm (Rouleau 2015)

Based on this premise, the following definition is put forward:

Strategy is the main outline through which an organisation seeks to attain its long-term/future objectives, with accompanying well-defined guidelines or plans for achieving them, structured in a way that explains who is responsible for what, how the business goals will be achieved and the tools required for attaining them, while considering the overall

Corporate Strategy, Fig. 1 Analysis of the strategy definition

direction for growth and the dynamism of the external environment.

This definition encapsulates key themes in strategy definitions as previously used by seminal authors in the field. The definition is further dissected in the figure below (Fig. 1).

The definition above brings together perspectives of authors over half a century, strengthening its validity and inclusiveness. Again, it is important to re-emphasize that the definition does not aim to be one size fits one but a synthesis of multiple definitions based on years of seminal research into the topic. This definition can also be easily adapted to various industries as opposed to industry-specific definitions available within the literature. Lastly, this definition encapsulates the more recent strategy-as-practice (SAP) view, which considers practitioners (those involved in the work of strategizing), practices (how they go about it), and praxis (the tools involved in the work of strategy).

Summary

Strategy is a complex and multifaceted concept, which has evolved over decades from its early days of use in warfare to its current state of adoption in understanding organizations and this entry. The current definition has considered different contexts, ranging from the long-term nature of strategy to the practice dimensions of the concept (i.e., those involved in strategizing, the work they do, and the tools they use). The definition has also highlighted the specificity involved in strategy, as it needs to be formulated to achieve a defined goal. Essentially, if there is no goal/objective in mind, there is no strategy.

Corporate Sustainability

Juniati Gunawan

Universitas Trisakti, Jakarta, Indonesia

Synonyms

Corporate social responsibility (CSR); Environmental management; Sustainability management; Sustainability strategy

Definition

Companies' sustainability occurred as an important factor in successful business strategy and operations, and the idea has a large variety of perception between instructors and practitioners. One of the important meanings of sustainability in corporate practice is the triple bottom-line (TBL) approach. It shows the contribution of the company to environmental, social, and economic performance (Dyllick and Hockerts 2002; Elkington 1998; Montiel and Delgado-Ceballos 2014; Norman and MacDonald 2004; Yu and Zhao 2015). Basically, TBL approach supports the long-range success of the enterprise and the environment; it is not a single short-term one but focuses on all aspects of sustainability: economic, environmental (natural environment), and social (social environment).

However, several academics debate that the function of corporate governance is for achieving long-term corporate performance (Evans et al. 2006; Kolk 2008). Corporate governance must be integrated into the TBL mechanism to assess corporate sustainability. Therefore, to make collaborative sustainability assessment, it represents the corporate sustainability as an incorporation of environmental, social, governance, and economic performance. This is sometimes referred as quadruple bottom-line (QBL) sustainability.

According to Porter and Kramer (2006), some companies have failed in their commitment to social and environmental sustainability, because their business strategy was not tied to initiatives of

sustainability. Porter and Kramer emphasize that companies need to “recognize shared value for social responsibility, not as failure control or public related campaign.” Strategic disruption to sustainability efforts results in fragmentation of a corporation’s sustainability efforts, resulting in the inability to dealing with the TBL aspects of frustration and sustainability.

Introduction

Many managers in the companies are increasingly aware of sustainability issues. Based on corporation’s view, sustainability includes economic, environmental, and social topics that can affect the businesses. Corporate sustainability has academical roots in the theory of stakeholder. Stakeholder theory identifies an organization is responsible to other stakeholders such as customers, suppliers, employees, and especially the larger community, not only to shareholders (Freeman 1984). Satisfying stakeholders’ claims is for various reasons, including maintaining a continuous supply and legitimacy of resources (DiMaggio and Powell 1983; Suchman 1995). Therefore, the sustainability approach in all companies should be based on stakeholder requirements.

Corporate sustainability is a dynamic idea and the particular environmental, economic, and social issues and priority that continually change the focus

of an organization. This can happen due to various reasons. The first one is the impact of internal and external environmental factors on the resources of the organization (Fig. 1).

These figures show three important perceptions. First, it indicates that the initial conceptualizations of sustainability have the environmentally friendly meaning, thus indicating a close perspective of its concept. The highlights of Seuring and Muller (2008) have been relatively narrow for environmental protection in early conceptualization of sustainability. However, in recent years, environmental protection has been highly recognized that only corporate sustainability subsets are available. Second, the figures are highlighted to be often argued in the study using the terms “triple P” and “TBL.” There are two points of view of the same idea. The figure above indicates that sustainability is an important thing of general business improvement. Corporate sustainability highlights that the most important stakeholder requirements must be systematically compliant. This is an organization’s legitimacy and licensing to continue their business in order.

The triple bottom-line approach cannot be described as traditional corporate accounting profit (the important point for calculation) plus environmental and social effects or else the profits of other enterprises are include social benefit. To enhance topics of accounting for social, environmental, and economic, there are a lot of business frameworks used around the world, including the EFQM

Corporate Sustainability, Fig. 1 The concept of sustainability (Asif et al. 2010)

Excellence Framework in Europe, the Baldrige Performance Excellence Framework in the United States, and the Australian Business Excellence Program in Australia. These assessment methods can support assessment and monitoring that are useful to stakeholders who want to know about TBL performance.

Key Issues

In corporate management, corporate sustainability has been knowledgeable by the vision of integrating environmental, social, and economic views. The “sustainability triangle” (Fig. 2) represents perception about management of sustainability (similar to Dyllick and Hockerts 2002; Schaltegger and Burritt 2005; Schaltegger et al. 2003).

The Sustainability Triangle is intended to support three commonly recognized parts of corporate sustainability, namely: the social, environment and economic perspectives. This Triangle help analyzing the cooperation to promote relevant information from sustainability management and made the implementation contributions. The reason is to provide an explanation for every element independently and the interrelationships among them. In the figure above, each element is presented with the aid of using one of the three corners, and the interrelationships are presented by a line connecting each corner. In this way, the corners forms the effectiveness of the company to achieve each component

individually and absolutely measured. On the other hand, the line represents various possibilities, such as eco- and socioefficiency, as well as eco-justice which can be described the composite of the three views. Effectiveness is intended to improve management with a single dimension (such as avoided waste and support income for the poor areas). On the other hand, efficiency represents the relationship between various dimensions, e.g., socio-efficiency for the connection among the economic and social dimensions (e.g., earnings in poor areas per unit of additional sales).

Amini and Bienstock (2014) suggest a multi-dimensional meaning of corporate sustainability illustrated with the aid of using a framework (Fig. 3) that contains a number of urban issues regarding corporate sustainability. There are several aspects of this framework: (1) communication of sustainability activities/overall performance and business-level application; (2) the focus range of organization; (3) innovation of sustainability oriented; (4) economic/ecological-environmental/equity-social emphasis; and (5) compliance stance. There are four levels of sophistication that we recommend. The knowledge about various levels of sophistication into this framework is made to comprise the interplay each most of the five dimensions of sustainability in the CS meanings, in addition to the dynamics of the interplay for those dimensions over time, as recommended by Lozano’s TTSE (2008) and Baumgartner and Ebner’s (2010) levels of maturity (e.g., level 1, indicating only

Corporate Sustainability,

Fig. 2 The sustainability triangle of perspectives of corporate sustainability management (Schaltegger 2013)

Dimensions of Sustainability	Business Level Application & Communication	<i>Ill defined sustainability initiatives within organization; no external communication with respect to CS activities</i>	<i>Tactical level sustainability activities; few external communications with respect to CS activities</i>	<i>Strategic level sustainability activities; some quantification & external communication of CS performance</i>	<i>Intrinsically sustainable zero-waste oriented organization; public disclosure of highly granulated sustainability performance data</i>
	Scope of Organizational Focus	<i>No supply chain interaction</i>	<i>Limited interaction with supply chain</i>	<i>Some information/resource sharing within supply chain</i>	<i>Significant information, resource sharing & optimization efforts across supply chain</i>
	Sustainability Oriented Innovation	<i>Innovation activities are not sustainability related</i>	<i>Some awareness of relationship between innovation and sustainability</i>	<i>Innovation activities begin to involve multiple stakeholders</i>	<i>Zero-waste approach involving significant sustainability oriented innovation (SOI) efforts that involve multiple stakeholders</i>
	Economic/ Ecology-Environmental/ Equity-Social Emphasis	<i>Emphasis solely on economic sustainability</i>	<i>Primary emphasis on economic sustainability, tentative efforts toward ecological-environmental sustainability</i>	<i>Triple bottom line approach, economic, ecological-environmental, equity-social sustainability</i>	<i>Organization embraces a "triple top line" sustainability approach</i>
	Compliance Stance	<i>Sustainability activities limited to minimal efforts at regulatory compliance</i>	<i>Sustainability activities increase beyond minimal regulatory compliance, but are not systematically related to organizational strategy</i>	<i>Incorporation of regulatory compliance within organizational strategy; participation in development & evolution of sustainability regulation</i>	<i>Recognized industry thought leader that embraces and encourages zero-waste approach to sustainability regulation; recognition of importance of public-private partnerships</i>
		I	II	III	IV

Level of Sophistication (I = least sophisticated; IV = most sophisticated)

Corporate Sustainability, Fig. 3 Corporate sustainability framework (Amini and Bienstock 2014)

rudimentary or no efforts to sustainability, through level 4, signifying significant, integrated sustainability intention).

Business-Level Application and Communication: Corporate sustainability will only succeed if the part of an effort of overall strategic (Porter and Kramer 2006) is aware to the effect of available resources for competitive advantage that needs development of skills (Hart and Dowell 2010). Except that a company's commitment to sustainability is inherently strategic, there is little commitment to cultural changes related to internal communication or sustainability in the organization or to the stakeholders (Linnenluecke and Griffiths 2010; Porter and Kramer 2006).

Scope of Organizational Focus: Referring to Hansen et al. (2009) highlight, organizations need to reach both customers and suppliers, i.e., an

organizational supply chain to ensure that CS efforts are successful and meaningful. The most demanding organizations show no interaction with the supply chain when it comes to sustainability efforts. As the organization's sustainability commitment becomes more sophisticated, the sharing information and resources of the organization supply chain partners are rising. The most progressive organizations will make great efforts to inform, share resources, and optimize when trying to incorporate sustainability activities through the supply chain.

Sustainability-Oriented Innovation: Organizations that are inexperienced in sustainability tend to have a little awareness of the relationship among sustainability and innovation. As the organization becomes increasingly sophisticated with respect to CS, they recognize the synergies between

innovation and sustainability, sustainability efforts, and integrating innovation by adopting product stewardship and sustainable design (Hansen et al. 2009; Hart and Dowell 2010). Complex organizations are inclined to implicate several stakeholders in their efforts to innovation and sustainability. The companies take a zero-waste approach to sustainability and are committed to the innovation of multiple stakeholders based on true sustainability.

Economic/Ecological-Environmental/

Equity-Social Emphasis: Organizations with the least experience with CS only highlight the economic sustainability. The organizations are not interested in ecological-environmental sustainability and equity-social sustainability; they do not understand the relationship between the aspects of sustainability. The more sophisticated an organization is, the more it understands the importance of equity-social and ecological-environmental sustainability and moreover economic sustainability and attempts to present the topics in several ways. The progressive companies take a triple top-line approach that incorporates economic, ecological-environmental, and equity-social awareness into the strategic decision-making and make a design process from the beginning.

Compliance Stance: As an organization matures, their CS activities shift from complying with rules to working on the evolution and development of sustainability regulations. Demanding organizations are increasing awareness of a proactive approach to sustainability that can minimize compliance-related cost and cost of liability. The most progressive organizations with the ideological leader in the industry usually promote and take part in supporting the zero waste approach to sustainability regulation (Hart and Dowell 2010). The organizations should realize about the importance of working with organization within or beyond their industry, as well as nongovernmental and government agencies, to facilitate sustainability and fulfillment efforts. Compliance with environmental policies can be difficult. Nevertheless, from a strategic and competitive standpoint, companies can be proactive and sophisticated before they are forced to

participate in the development of environmental regulations, or even better, by complying with them.

The framework shown above emphasizes the link among regulatory compliance, business strategy, sustainability, and innovation; includes the role of corporate communications to sustainability; highlights the concerns of working with supply chain partners for a successful sustainability initiatives; and emphasizes the purpose of harmonizing the sustainability aspects (economic, equity-social, and ecological-environmental).

The connotations of the sustainability framework for practitioners include the implications of integrating sustainability into external communications and strategies of corporation with corporate stakeholders; the implications of involving an organization's supply chain in its attempts to sustainability; an example of a possibility synergistic effect among sustainability and innovation; the impact of integrating economic, ecological-environmental, and equity-social awareness in design processes and strategic decisions; and the ramifications of presenting as an industry thought leader in shaping sustainability regulations. In summary, this framework can help the assessment of sustainability activities and help organizations improve the sustainability level and maturity of their activities.

Summary

This series of studies shows that companies' investment in social and environmental programs can fascinate more resources, enhance the image of their corporate, and increase economic performance. The positive influence of social and environmental performance on economic performance presents evidence in supporting the hypothesis of the social impact (Cornell and Shapiro 1987; Freeman 1984; Pava and Krausz 1996; Preston and O'Bannon 1997).

Stakeholder theory recommends that a firm needs to make a value for stakeholder and shareholders, including employees, customers,

communities, suppliers, investors, and others involved in the organization (Freeman 1984). Stakeholder theory has provided a platform for learning the corporate sustainability's effect on corporate economic performance. Corporations that are responsible for a larger group of stakeholders will increase their economic performance and generate value (Driver and Thompson 2002; Harrison and Wicks 2013). Referring to stakeholder theory, the hypothesis of the social impact is interconnected relationships between a company and every individual who has social effects on the company through social drivers and barriers. Several supporters assume that good social performance, i.e., meeting the requirements of the company's stakeholder, will ultimately increase the economic performance (Preston and O'Bannon 1997). A company's involvement in environmental, social, and governance activities that reach the expectations of stakeholders will enhance the reputation of the company and give some positive influence on economic performance. Otherwise, disappointed stakeholders can create a negative influence on the economy by enhancing the perceived risks and the cost of capital. As a result, this brings to the hypothesis in the research.

Corporate Sustainability and Responsibility

Benedict Sheehy¹ and Mark Anthony Camilleri²

¹Canberra Law School, University of Canberra, Bruce, Australian Capital Territory, Canberra, ACT, Australia

²Department of Corporate Communication, Faculty of Media and Knowledge Sciences, University of Malta, Msida, Malta

Introduction

The terms corporate social responsibility “CSR” and corporate sustainability tend to be used either interchangeably or without clear attention to the difference (Sheehy and Farneti, 2021). The terms

focus on different but related areas of activity: business management, social action, and the natural environment.

In its essence, CSR is a form of international private business regulation focused on enterprises’ environmental and social impacts (Sheehy 2015). It includes a host of individual and collective rights as well as ethical and environmental issues. It has been a bottom-up push focused on business which has led to a response from global policy makers (Kuper 2005; Rasche and Waddock 2014; Sheehy 2017a, b; Voegtlin and Pless 2014). By way of contrast, corporate sustainability is a rather diverse set of ideas originating from environmentally focused activists, global development groups, and environmental professionals and specialists focused on business. Finally, although both terms refer to the concept of business ethics, they do so in quite different ways.

Both terms are added to the broader term sustainability. For example, accounting scholars Bebbington and Gray (1996) integrate the terms sustainability, sustainable development, and business stating, “at a minimum, the sustainable business is one that leaves the environment no worse off at the end of each accounting period than it was at the beginning.” This use conflates the terms with the global public policy agenda of sustainable development, most recently enacted as the Sustainable Development Goals.

Corporate Social Responsibility

CSR has been part of the business dialogue since the late 1920s. Two law scholars argued about the role and obligations of company directors. One argued that corporate managers were responsible solely to shareholders while the other argued that the corporate managers were statesmen [sic] to use their powers for the betterment of society (Sommer 1991). The debate was taken forward through the 1950s with Bowen’s classic work, the *Social Responsibilities of the Businessman* (Bowen 1953). A range of further developments in the business-and-society

Corporate Sustainability and Responsibility,

Fig. 1 Carroll's CSR Pyramid

discussions expanded the concept and obligation drawing in ever more concerns and parties leading to a vagueness around the term (Camilleri 2017). Archie Carroll created order by producing a hierarchical pyramid for categorizing and prioritizing business obligations when considering business-society relations (Carroll 1991) (Fig. 1).

Carroll proposed dividing CSR into four tiers of responsibilities prioritized from basic ones at the bottom to the ethical ones at the top. Carroll argued that the first responsibility is to be economically sound and then secondly to comply with the law. The third level of responsibility he posited was ethical. Executives were avoiding harm and contribute to positive justice by treating other parties fairly. Finally, at the top level, once all other obligations had been fulfilled, Carroll argued that the firm has philanthropic obligations.

CSR in theory and practice has developed slowly from consideration of directors' obligations, through a hierarchy of management choices, to the point where it can now be properly defined as: "international private business self-regulation" (Sheehy 2015). Sheehy's definition draws in international soft law norms directed at business organizations. In this definition, CSR is understood as regulatory in that it is a set of norms aimed at effecting business behavior – a type of soft law, rather than a business strategy.

Corporate Sustainability

Corporate sustainability is a concept that is significantly different from CSR. Like CSR, corporate sustainability accepts the view that companies have a wider responsibility beyond profit (Hahn and Figge 2011, 325). Unlike CSR, however, corporate sustainability is a much more recent concept with roots in environmental and global policy. In the former, it grew out of the corporate environmental movement, which arose in the 1970s to address a range of environmental disasters that captured public attention (Sheehy 2019).

Corporate environmentalism, however, was not an end point, and environmental concerns about the industry were swept up in economic and political globalization marked by, among other things, the increase in power of multinational enterprises over the intervening decades (Osterhammel and Petersson 2005; Scholte 2005). In this intervening period, business came to be viewed as a "partner" in society, and in this case, a global development partner. The term corporate sustainability thus arises from this confluence of concerns and the dynamic political landscape. The term corporate sustainability took on additional meaning as part of the effort to bring business into alignment with the UN's development program, the Sustainable Development Goals (SDGs).

The term "sustainability" can mean different things to a variety of constituencies. While there

may be no objection to the sentiments expressed by multiple stakeholders on the respective definitions for sustainable business, most of them are far from holistic. The sustainability systems may be too complex and varied, and their applications could be quite diverse. Some authors have attempted to relate sustainability with the corporations' responsible behaviors (Camilleri 2017). Dyllick and Hockert's widely accepted definition of the term "corporate sustainability" is most useful. They define corporate sustainability as "meeting the needs of a firm's direct and indirect stakeholders (such as shareholders, employees, clients, pressure groups, communities, etc.), without compromising its ability to meet the needs of future stakeholders as well" (Dyllick and Hockerts 2002). Their definition makes no explicit mention of environment although it is certainly implied. Others such as Hahn and Figge state that "there seems to be some implicit pragmatic consensus that corporate sustainability refers to some composite and multi-faceted construct that entails environmental, social, and economic organizational outcomes" (Hahn and Figge 2011, 327). These pillars are interconnected to each other where the economy is part of society, which is also a fundamental part of the larger ecological system. Corporate sustainability relies on six criteria: eco-efficiency, socio-efficiency, eco-effectiveness, socio-effectiveness, sufficiency, and ecological equity (Dyllick and Hockerts 2002). These corporate sustainability imperatives can be structured into value systems that could result in a better financial performance (Salzmann et al. 2005; Van Marrewijk 2003). A few researchers have developed (self)-assessment tools that could be used to audit, analyze, and interpret corporate sustainability (Van Marrewijk 2003). However, corporate sustainability may be contingent on different parameters (e.g., technology, regime, and visibility) that could vary across industries, plants, and countries (Salzmann et al. 2005). Corporate sustainability could reduce the downside operational risk as it comprises relevant measures that are intended to increase eco-efficiency and health and safety performance, among other issues (Porter and Kramer 2019; Camilleri 2014). This means that the economic

value of sustainable business strategies could be materialized in the long term (Weber 2008).

Notwithstanding, there are the long-term effects of corporate sustainability on intangible assets (e.g., brand value, employee loyalty) could be difficult to quantify (Salzmann et al. 2005; Dyllick and Hockerts 2002). Although some commentators have voiced their opposition to the normative calls in favor of the "sustainability rhetoric" (Salzmann et al. 2005), it may appear that we are witnessing a relentless progression from active antagonism, through indifference, to a strong commitment to actively furthering sustainability values, not only within the organization but across many industries and in our society as a whole. These recent developments imply that the organizations' commitment to responsible behaviors may represent a transformation of the corporation into a truly sustainable business that is adding value to the business itself, while also adding value to society and the environment (Camilleri 2016).

Beyond management disciplines, the term corporate sustainability refers to the assessment of business conduct with reference to the ecological limitations of the planet. Beginning with the limitations of the earth's ecosystems, this group of scholars works down to the level of industrial production to argue that for sustainability reasons, businesses must change their methods of production as part of a larger change society must have with respect to its relationship with the environment (Sjåfjell and Richardson 2015).

Summary

Corporate sustainability and CSR are related but distinct concepts. Corporate sustainability is derived from the corporate environmental movement. In contemporary use, it is a concept that begins with an analysis of the limitations of the earth's ecosystems. It then works down to the implications for business organizations. By way of contrast, CSR is a form of international soft law directing business behavior to align with global norms touching on social and

environmental practices as well as corporate governance.

Corporate social performance; Corporate sustainable development performance; Triple bottom line (TBL)

Definition

Corporate sustainability performance (CSP) is a notion that reflects the outcome of the implementation of a firm's corporate social responsibility policies and practices. There has been a growing interest from both researchers and practitioners on understanding and assessing the results of a company's total sustainability efforts such as saving resources and energy, reducing environmental risks, adding value to communities, promoting sustainable consumption, and conducting effective corporate governance. Sustainability in the business context can be termed as "corporate sustainability" (see chapter ► "Corporate Sustainability Reporting Index"), referring to the integration of long-term social, environmental, and economic concerns into a firm's management and operations. That is, it represents the responsibility of the firm to the society that goes beyond maximizing shareholders' return. Then, CSP can be defined as the extent to which a company meets and balances current and future expectations of diverse stakeholders while safeguarding human, natural, and economic resources (Artiach et al. 2010). In other words, it reflects the general assessment of how effective and efficient corporate sustainability practices produce environmental, social, and economic changes. The essential idea behind CSP is that if a firm follows sustainable

development goals, it may increase its future value for both itself and those parties who are related.

Introduction

Nowadays, the business world shows higher levels of concern and a more proactive approach toward sustainability. It has become an integrative way of doing business including several issues such as environmental protection, reduction of carbon emissions, social justice, community relations, governance transparency, and labor rights (Baumgartner and Rauter 2017; Schaltegger et al. 2016). Such efforts also represent the increasing demand and pressure from diverse stakeholders who are paying increasingly more attention to environmental, ethical, and social performance besides economic one, which motivates them to reward or penalize corporations according to their sustainability activities and impact (Hahn et al. 2015). This responsiveness may threaten or strengthen a company's survival. Some industries such as energy, food, health, and medicine feel this pressure even more than others do (e.g., Chih et al. 2010; Chang et al. 2017; Pandey et al. 2019). As a result, measuring and reporting sustainability practices has become a significant task for corporations. The attention is growing worldwide where several national and international initiatives such as Global Reporting Initiative and UN Global Compact encourage, direct companies for reporting sustainability, and provide specific guidelines to do so.

Through the development of corporate sustainability research, the emphasis on CSP has emerged much more recently after the early discussions about the meaning, legitimacy, and extent of corporate sustainability for firms. Yet, it has become one of the fundamental concerns as the real value of corporate sustainability practices depends on to what extent their impact can be identified and measured. Wood's framework (1991) can be regarded as one of the early conceptualization of CSP where he argues corporate social performance depends on the principles of

social legitimacy, public responsibility, and managerial discretion. Based on these principles, CSP can be measured in terms of three corporate outcomes: social impact (e.g., desired good and services, pollution prevention, waste management, value creation for community), social programs used to put responsibility into effect, and policies developed to manage responsibility issues and stakeholder demands.

Lately, calls have been made to companies for moving toward a better integration of their sustainability initiatives in their decision-making processes and linking their sustainability efforts to financial performance. However, this linkage entails several trade-offs as companies face organizational constraints and other challenges in implementing their sustainability strategies (Van der Byl and Slawinski 2015). Managers are usually uncertain about how to reconcile sustainability and financial concerns. Hence, well-thought evaluation systems are required for deciding what sustainability projects should be pursued, which organizational resources should be allocated to these projects, and how to evaluate their social, environmental, and financial impact in short-term and long-term outcomes.

For evaluating CSP, different approaches have been discussed and introduced. Most of these models were developed by considering multiple corporate sustainability practices. Any improvements in these practices contribute to the total sustainability score of the firm. In early conceptualizations, only three facets – environmental, social, and economic – were offered to measure corporate sustainability, which was coined as the “triple bottom line” (Elkington 1997) (see chapter ► “Triple Bottom Line”). However, in recent years, this view is enhanced through the integration of new facets as higher emphasis has been given to different sustainability issues. For instance, the “economic, social and governance model” (ESG) has been offered as a new framework adding the health of corporate governance to existing CSP criteria. Moreover, studies increasingly argue the necessity of considering technological factors in assessing corporate sustainability.

More recently, emphasis is also given to the innovation aspect of corporate sustainability (Schaltegger et al. 2016). While innovation is usually described as the driving force behind economic and social change, sustainability has long been recognized as an innovative force carrying the potential of creating new products and processes by challenging the traditional ways of doing things. Triple bottom line can be regarded as an indicator of it, which has radically contested and changed the way corporate performance is evaluated. Sustainability also reflects the ability of an organization to explore new resources and capabilities for preparing itself to future conditions and needs beyond current ones.

The Link Between CSP and Firm Performance

A review of the literature reveals that in recent years, research on CSP–firm performance association have been significantly growing both theoretically and empirically (e.g., Goyal et al. 2013; Jo et al. 2015). There is an ongoing debate about how to insert corporate sustainability into business strategies and through which mechanisms the results of sustainability initiatives turn into economic outcomes for the firm. This debate emerges from the fundamental question of whether sustainability practices indeed contribute to the overall value of the firm. Prominent theories including stakeholder theory and resource-based view suggest that CSP may increase benefits for the firm through better relationships with key stakeholders. Improved stakeholder relationships (e.g., community, customer, and employee satisfaction) create positive reputation, ensure the continuation of access to critical resources, and improve the ability of developing new resources and capabilities, leading to a sustainable competitive advantage (Lozano et al. 2015). Additionally, the disclosure of sustainability provides relevant information and value for investors. In the end, CSP results in better financial performance.

Despite opposite arguments on the inefficient use of resources for satisfying conflicting interests

of multiple stakeholders, cumulative evidence indicates a positive impact of CSP on firm performance, and this is more so in technology-based service industries (Jung et al. 2018). Still, there is no universal formula for this relationship and it varies much according to the underlying social, legal, and economic context. Some studies found that the positive association depends on a set of other factors including firm size, leverage, R&D investments, marketing intensity, innovativeness, and the ability of product differentiation (e.g., Artiach et al. 2010; Chih et al. 2010). In addition, industries with rapid growth, changing market trends, and severe competition maximize the benefits of CSP (Chang et al. 2017). However, the CSP–firm performance relationship has been mostly examined in developed countries whereas studies from developing countries are quite limited.

In a comprehensive conceptual framework covering these relationships, Epstein and Roy (2001) claim that existing corporate strategies first provide sustainability performance with respect to different areas of business. In turn, this sustainability performance causes reactions from stakeholders including employees, customers, community members, government authorities, and investors. Each of these linkages is improved by the support of firm sustainability actions in the form of plans, programs, structures, and systems. In the final stage, positive stakeholder reactions bring about long-term financial performance. Thus, sustainability performance and stakeholder reactions act as intermediate outcomes that should be carefully monitored and managed. Finally, the feedback provided from reactions of diverse stakeholders is used to evaluate the appropriateness of company goals and strategies and to revise them if necessary (Lozano et al. 2015). Overall, the breadth of information passing through this framework allows managers to examine every step of sustainability and how these steps are interconnected so that they can make sustainable decisions for their business. Similar frameworks all argue that once organizational strategies, structures, and management initiatives are successfully aligned, a company will be in a better position to coordinate its activities and motive

the whole organization toward implementing sustainable strategies (Searcy 2012).

Determinants of CSP

Based on different approaches such as institutional perspective, resource-based view, resource dependency theory, and stakeholder theory, several internal and external context factors have been identified as significant determinants of CSP (e.g., Bansal 2005; Campbell 2007; Artiach et al. 2010; Chih et al. 2010). Perhaps, the largest and most consistent evidence regarding firm characteristics has been shown for the impact of organization size. Larger firms have higher visibility and public scrutiny, drawing attention from a wide range of stakeholders. Capacity to engage in sustainability practices also increase with organizational size as resources and capabilities that can be devoted become larger. Moreover, big firms usually have organizational slack permitting them to seek sustainable solutions. Financial capacity and health of the company (e.g., high return on equity, free cash flows, low debt financing) also increase the capability to undertake sustainability activities by allowing the company to act more flexibly and to meet stakeholder expectations at a larger extent (Artiach et al. 2010). Capacity for growth is another important determinant of CSP as R&D intensity as well as product innovations and differentiations lead to expanding business operations, all of which increase the opportunities to implement sustainability principles and strategies.

Ownership type and concentration were also found to be associated with CSP. Public companies and those companies whose ownership is less concentrated have a better sustainability performance. Higher public accountability prompts them to engage more in sustainability activities and such scrutiny is doubled when a firm is listed in multiple stock exchanges. Studies suggest that degree of internationalization and international experience also leads to better sustainability performance (Park 2018). Firms with international experience are in a better position to develop certain systems and structures for getting adapted into different economic, legal, and cultural

environments. They can also acquire the best knowledge available and better coordinate their sustainability practices across their operations.

Finally, top management characteristics such as managers' commitment to ethics, management capabilities, and corporate governance structure are suggested as key determinants of CSP (e.g., Crifo et al. 2019; Morioka and Carvalho 2016). It is argued that sustainability control systems based on certain standards and guidelines may offer the governance instruments necessary for generating any corporate sustainability effort and getting favorable performance results out of them. If these structures are integrated with the components of the supply chain, sustainable development initiatives will be better supported and positive results will be more likely.

Aside from firm attributes, environmental factors including legal, market, economic, and socio-cultural ones may also play role in predicting CSP. Evidence shows that stronger legal policies and regulations make firms engage in more sustainability activities. This is because failure to comply with these regulations incurs fines and penalties that the firm wants to avoid and it reduces the incentives to behave in irresponsible ways. However, weak economic environments (e.g., high inflation, low growth, low productivity) can make it difficult for firms to behave in sustainable ways. Mimicking other companies and media pressure can also stimulate a firm to make larger sustainability efforts. Firms are likely to imitate peers who have visible and well-defined sustainability activities and who are recognized for their favorable CSP. Besides increasing a firm's visibility and public scrutiny, media can also have an indirect effect through shaping institutional norms and mobilize social movements. Institutional pressures may also come from independent organizations such as business associations, institutional investors, NGOs, and community groups. Such self-regulation mechanisms are likely to increase sustainability engagement and CSP. Finally, the nature of firm's relationship with its stakeholders, the pressure they put on the firm, supply chain management systems, and the availability of interorganizational networks are also considered to be closely associated with CSP.

Besides these factors, studies indicate important differences in the sustainability performance of firms across industries regarding intensity of market competitiveness, uncertainty levels, and availability of resources (e.g., Maletic et al. 2018; Morioka and Carvalho 2016). If the market has high competition and ambiguity, firms act in more sustainable ways to increase their competitive advantage. If competition is low, the firm will have no interest in using sustainability strategies to gain competitive advantage. Taking all these factors into account, it can be concluded that coercive, normative, and mimetic institutional pressures in the environment as well as market conditions and demands from multiple stakeholders may bring a huge motivation to the firm for implementing corporate sustainability strategies. Yet, evidence shows that these influences might change over time regarding the age and industry experience of the firm. Overall, as Morioka and Carvalho (2016) claim, internal and external context factors together with key principles of corporate sustainability lead to the development of sustainable business processes and practices, which in turn, contributes to CSP with short-, medium-, and long-term effects.

Measurement of CSP

The existing forms of CSP assessment can be summarized in three categories. The first type of sustainability performance measures comprises the analysis of the information a firm communicates about its social responsibility efforts (e.g., Antolín-Lopez et al. 2016; Bansal 2005; Searcy 2012). The idea behind this is that when a firm engages more in responsibility activities, it intends to communicate and disclose these activities through available channels. On the other hand, if a firm has less social responsibility efforts or seeks to hide something such as a failure in fulfilling certain responsibilities, it avoids the communication. The second type of CSP assessment constitutes business rankings evaluating sustainability efforts of firms across multiple indicators (Bansal 2005). A number of independent firms have been established with the pure purpose

of sustainability assessment by examining firm policies, practices, and systems related to social environmental risks. The last form for CSP measurement includes the use of a set of direct financial market indicators such as Dow Jones Sustainability Index and Socially Responsible Investment Index, which are particularly essential for influencing investor decisions (Antolín-Lopez et al. 2016).

Several international, regional, and national organizations deal with the measurement of CSP. Some of these prominent institutions and frameworks are Global Reporting Initiative (GRI), International Integrated Reporting Council, International Standards Office (ISO), United Nations Global Compact, UN Conference on Trade and Development (UNCTAD), CFA Institute, European Academy of Business and Society, B-Corporation, and more recently, UN Sustainable Development Goals. Different stakeholders such as academics, investment rating agencies, and nongovernmental organizations have also developed their own CSP metrics and measures. These CSP guidelines or frameworks usually involve environmental, social, and economic factors, and the necessary information is taken from company disclosures.

Whatever assessment system is used, measurement of CSP almost always involves a set of underlying indicators. Sometimes, these indicators are used individually. However, a composite index (see chapter ► [“Corporate Sustainability Reporting Index”](#)) is often created based on a number of factors chosen from a pool of economic, environmental, and social sustainability disclosure items available in company reports and websites (Lee and Saen 2012; Docekalová and Kocmanová 2016). The benefit of using a composite index is the ease for interpreting diverse sustainability facets by a single figure, thus overcoming the complexity of the phenomenon and providing sensitized information while maintaining its underlying multidimensionality and information base. Both generic (e.g., Searcy 2012) and industry-specific (e.g., Labuschagne et al. 2005) indices are available, each one using different items, weights, benchmarks, and calculations. Despite the existing index multiplicity,

one can summarize the key CSP indicators used in available composite indices under four main sustainability categories as in Table 1 (based on different studies). Such integration and aggregation systems may also be used as a means for identifying the priorities for corporate sustainability improvements through comparisons across different sustainability facets and decomposition analysis. Firms can also assess their performance against competitors and make future business decisions by using these indices.

Several CSP measurement analysis tools have also emerged that can be subjective, objective, or a combination of the two. Some objective and quantitative methods include multi-criteria decision-making technique, multi-attribute utility approaches, data envelopment analysis, principle component analysis, entropy analysis, and TOPSIS-based methods. They may be used in tandem as well as individually. Fuzzy sets or fuzzy reasoning is commonly used to quantify verbal data. Recently, more graphical approaches such as similarity graphs have also been adopted.

Summary and Future Directions

One of the concerns about CSP is that there is still no broad agreement on how to measure it. Even though corporate sustainability is a complex and multidimensional phenomenon, the lack of clarity and standardization in its operationalization and the existence of a variety of metrics developed by different sources leads to important confusions for both practitioners and researchers. Therefore, there is still an ongoing debate on what aspects and dimensions of CSP should be accounted for and why. Enhanced CSP instruments are expected to provide companies a good viewpoint in decision-making and to allow comparisons among companies.

There is also a debate on the disproportionate emphasis on sustainability indices and metrics to evaluate CSP. Other aspects such as sustainability awareness, the nature of relationships with different stakeholders, and how these relations should be managed in an organization are often overlooked compared to the bulk research on quantitative sustainability indicators and relevant

Corporate Sustainability Performance, Table 1 Key corporate sustainability performance categories and indicators

Environmental indicators	Social indicators
Energy conservation (efficiency and savings; clean energy) The use and management of materials Fuel consumption Water consumption Waste management and recycling Emissions and pollution (e.g., carbon reduction, ecological footprint) Biodiversity Investments for environment (environmental management systems) Distribution and transportation Environmental risks Environmental compliance to laws and regulations	Human rights Code of ethics Labor relations (union membership, collective agreement, etc.) Equal access, treatment, and opportunities to employees Human capital (training and development) Health, safety, and security at work Good relations in the workplace Stakeholder participation Adding value to local community Adding value to customers Sustainable consumption (e.g., product safety and usefulness)
Economic and financial indicators	Governance indicators
Economic results (financial growth, profit, return on sales, cash flow, etc.) Costs (total costs, operational expenses, etc.) Investments (return on investments) Efficient use of assets and funds Productivity Supplier relations and contracts Innovation Credibility and economic sanctions Contribution to local, national, and global economy	Corporate strategies and policies Top management characteristics Effectiveness of corporate governance (e.g., board of director composition) Risk and crisis management Compliance with laws and regulations Involvement in politics and government relations Relations with other stakeholders

Source: Adopted from Searcy (2012), Lee and Saen (2012), Labuschagne et al. (2005), and Docekalová and Kocmanová (2016)

statistical analyses. Therefore, one of the future directions for improving the understanding of CSP may include internal processes, strategic human, information and external resources, awareness, perceptions, and the management of corporate sustainability. The ongoing research on how resources as inputs are transformed into sustainability results can be expanded. Moreover, CSP might be interpreted based on how stakeholders are assigned to different components of it. In this way, the gap between what is measured and what is managed can be reduced. Using different theoretical lenses, certain causes and mechanisms through which sustainability performance is attained in companies can be examined in more depth. Such investigations may also go beyond the individual firm and include significant upward (suppliers) and downward (distributors and buyers) members of the supply chain and other stakeholders such as employees, parent companies, community, NGOs, scientific institutes, competitors, media, and policy makers.

There are several unanswered questions regarding the design of a CSP system as well as the implementation and use of such a system. Numerous procedural, contextual, implementation, and content issues remain to be explored for developing a CSP system that meets the needs of business as well as the society (Searcy 2012). As companies face diverse stakeholder expectations, constantly changing concerns and a large set of options to handle sustainability challenges, a reliable system for assessing CSP becomes necessary. This system can be designed with policies and programs that are customized for the firm and linked to clear sustainability goals.

Corporate Sustainability Reporting

► Sustainability Management and Reporting

Corporate Sustainability Reporting Index

Selena Aureli
Department of Management, Bologna University,
Bologna, Italy

Synonyms

CSR index; Environmental index; Social index

Description

A sustainability reporting index is a synthetic and measurable information on a company's commitment in making its business activities more sustainable. In order to calculate it, researchers and/or specialized CSR rating agencies shall define a methodology for evaluating and weighing performances in each relevant areas (usually categorized into environment, social, and economic dimension – the so-called triple bottom line). The most diffused sustainability indices are those created by rating agencies (e.g., the DJSI or FTSE4Good) that assign scores to listed companies with the final goal of including or excluding them from a list of the best performers. These indices have a great importance not only for their impact on a company's reputation but also for providing information to investors that are becoming more and more interested in sustainable investments.

Introduction

Corporate social responsibility (CSR) and sustainability reporting is mainly a voluntary practice

diffused among large companies worldwide (KPMG 2013) that aim to increase transparency toward stakeholders on their strategies and practices that may have an impact on the environment and society. Reports are actually a mean to demonstrate awareness of their own responsibility toward society and environment.

This disclosure of nonfinancial matters – an umbrella term used to refer to qualitative and quantitative information different from financial data (Haller et al. 2017) – greatly evolved from the first attempts recorded in the 1960s and 1970s. In some national contexts, CSR, sustainability, and social or integrated reports have become compulsory for certain entities. Both voluntary and obligatory nonfinancial reports usually follow dedicated standards and guidelines that increase their credibility (Salvioni and Bosetti 2014). Global Reporting Initiative (GRI) guidelines, the Eco-Management and Audit Scheme (EMAS), the Organization for Economic Co-operation and Development (OECD) Guidelines for multinational enterprises and the International Organization for Standardisation's ISO 26000 – just to name a few – are common frameworks that set general principles and list key performance indicators (KPI) that companies can use to measure and report their economic, environment, and social performance. Reports actually provide a large amount of data for each category or area of impact and are full of details on company's sustainability policy and goals. This makes them difficult to read and synthesize. Comparison with competitors or other companies is also difficult if KPIs and reporting standards differ. Therefore, both academic researchers and firms specialized in CSR have begun to develop “global” indices that may favor a quick and comprehensive evaluation of company's involvement in sustainability and allow for intercompany comparisons.

Several research papers have developed a corporate social responsibility or sustainability index from the analysis of reports published by companies. Most of them rely on content analysis or text mining techniques to check for the presence and frequency of certain topics. Unfortunately, many researchers have developed their own framework

and method of evaluation, with or without weights, aiming to improve assessment reliability. Sometimes, they develop a specific sustainability reporting index to account for industry characteristics (see, e.g., Bonilla-Priego et al. 2014). As a consequence, there is not a common accepted framework or method used systematically to compare sustainability performance through time and space.

Similarly, consultancy firms specialized in CSR aspects have begun to evaluate companies' sustainability performance to assign them scores and create ranking lists. These firms are usually known as CSR rating agencies (see Waddock (2008) for an extensive discussion of these organizations). Also in this case, the methods of data collection and analysis vary (some focus on public reports only, while others integrate information through questionnaires, interviews or by screening specialized media), and it can become difficult to compare results across rating agencies (see Chatterji and Levine 2006 for this and other problems), thus undermining the ability of stakeholders to discriminate among more or less reliable ratings. However, consultancy firms have been more successful in creating indices used by stakeholders, and especially investors. Since investors are increasingly interested in the risks associated to ESG (environmental, social, and governance) issues and they tend to create portfolios that include sustainable companies (EY 2017), consultancy and rating firms have developed rating systems that allow the creation of sustainability stock indices (baskets of stocks referring to the most sustainable companies) that describe the financial performance of these businesses.

Functions of Stock Indices in General and Sustainability Stock Indices

In order to assess how a certain financial market is performing (e.g., the London Stock Exchange) and compare the return on specific investments, investors and financial managers usually refer to a stock market index, which is computed from the prices of selected stocks (typically a weighted

average). Therefore, indices show the market performance at a precise point in time, while their value changes when stock prices change.

Stock exchanges of all countries usually have several indices that consist of different hypothetical portfolios of securities representing a particular segment of the market. So, the London Stock Exchange continuously discloses performances of the FTSE 100, FTSE 250, FTSE 350, and FTSE All Shares, where the numbers refer to the amount of companies included in the index calculation (i.e., the 100, 250, or 350 most highly capitalized companies traded on the London Stock Exchange). The three most popular stock indexes for tracking the performance of the US market are the Dow Jones Industrial Average, S&P 500, and Nasdaq Composite, while the Stoxx Europe 50 is the popular market index of the largest blue-chip companies from 18 countries in the Eurozone.

Investors cannot invest directly in an index, so these portfolios are used for two main purposes: (1) as benchmarks and (2) for developing index funds. In the first case, indexes allow investors to compare the performance of individual stocks they purchase with more general market indicators. The need for benchmark comparisons had led to the creation of specific indices that refer to geographic segments of the market (e.g., stocks of companies from emerging markets) or to micro-sectors. Recently, many financial markets have also began to calculate sustainability indices that include a basket of stocks of companies that demonstrate to make all efforts necessary to minimize their negative impact on the environment, community, society, or economy. In the second case, indices are used by investment funds to offer to individual investors a financial product that replicates the index, that is, a product whose strategy is to buy and hold all stock constituents in an index. Individual investors cannot invest in an index without buying each of the individual holdings, which is generally too expensive from a trading perspective. Therefore, investment funds offer a low-cost way to invest in a comprehensive index portfolio, gaining exposure to a specific market segment of their choosing. The same logic can be replicated when investment funds aim to offer a sustainability-based portfolio to their clients.

A socially responsible investment (SRI) fund usually tries to invest in companies or governments with the best ESG scores because it is assumed that meeting ESG standards is likely to yield to higher returns, while reducing portfolio's risks. As any other fund, SRI funds seek to maximize medium- and long-term returns, but they do it searching for companies with robust corporate governance policies, which care for the environment and minimize potential regulatory, litigation, and reputational risks.

From a company perspective, being included in a sustainability index is like having a badge that identifies sustainability leaders because only the companies that meet certain minimum sustainability requirements are selected for index membership. It is a form of public endorsement of companies' attention toward the local environment and society. This increases a company's reputation among all its stakeholders and makes it more attractive to investors. Considering that there is an increasing amount of SRI funds, specialized investors attentive to company CSR practices and also traditional investors progressively more scrutinizing nonfinancial aspects of corporate performance, a company included in a social or sustainability index is in the position of being immediately classified as a good target for investors' portfolio.

Today, there are many different indices that promise to sort the most sustainable companies (see section "[Types of Indices and Rankings](#)"). The diffusion of these sustainability indices is due to the fact that it is difficult for managers and investors to know whether a company is actually engaged in responsible behavior. Institutional intermediaries that scrutinize, classify, and rank companies are held to provide reliable information. Their institutional endorsements (and reputation) can strongly influence market assessments of a firm's social responsibility.

Rankings and Classifications

The increasing importance for companies of the reputational impact associated to a third-party evaluation and the growing investors' demand

for ESG screening have generated a proliferation of private organizations that offer information services and rankings of companies based on their sustainability performance (Scalet and Kelly 2010).

In addition to information providers that collect and elaborate data to identify sustainable companies to be included in sustainability stock indexes, there are many other organizations that use their own evaluation method, assign scores, and prepare their own list. These organizations can be categorized into two groups:

1. Organizations that sell their services to both investors and companies that want to be evaluated
2. Not-for-profit organizations and research centers that want to improve the culture of sustainability and make stakeholders more informed

In the first case, organizations are ESG rating agencies that provide highly detailed information on companies but this information is sold to investors, SRI funds, and other subjects. Data can be customizable and besides assigning scores, they disclose information on company risks related to ESG and controversies and litigations. In addition, they help investors and investment funds to create financial products (a customized investment universe) that include sustainable companies. Another important group of clients of these organizations is made by companies or governments that want to be evaluated. While making the assessment, rating agencies offer guidance on how companies may better meet their CSR commitments. So, they suggest how to improve CSR policies or accompany a company in the path toward the achievement of a CSR certification or label.

In the second case, organizations are foundations or NGOs that want to increase people's awareness on the impact of corporations. Information is usually freely available and often refers to specific ESG areas. For example, the Human Rights Campaign Corporate Equality Index (Equality) is calculated every year and disclosed in the HRC's CEI report with the aim to describe policies and practices pertinent to lesbian, gay,

bisexual, and transgender employees of large US employers. In this case, scores and rankings are used to indicate the “Best Places to Work.” Similarly, the *NewsWeek* magazine annually discloses its environmental performance assessments of the largest publicly traded companies named “NewsWeek Green ranking” with reference to the United States (US 500) and the world (Global 500). In this case, data is obtained from Bloomberg, FactSet, Thomson Reuters, and the Carbon Disclosure Project. In addition, all companies are contacted for data verification once all available items of data have been obtained.

This distinction between ranking organizations becomes blurred when we consider CSR Hub and similar collectors of ESG information that provide access to corporate social responsibility and sustainability ratings to service subscribers paying an annual fee (usually investors, researchers, activists and managers interested in comparing CSR performance with competitors). These organizations do not make their own evaluation from questionnaires or by reading sustainability reports. They aggregate data coming from socially responsible investing research firms, well-known indexes, publications, and “best of” or “worst of” lists.

Although company evaluation methodology may appear different, there are many similarities. Most of these frameworks derive from existing reporting standards like GRI guidelines, ISO 26000, UN Global Compact, etc. All company evaluated receive a score (or several scores for each ESG dimension), so it is possible to compare sustainability performances with peers and through time. Scores can be expressed through numbers, letters (e.g., from A to F), or levels (e.g., ranging from advanced to robust, limited and weak).

Types of Indices and Rankings

There are several indices and rankings that serve a valuable information dissemination function. These are usually defined by specialist ratings agencies that select companies for their results in the three ESG areas or in specific fields or

thematic areas such as diversity. Below the main international sustainability indices are briefly described (the order of appearance does not reflect the degree of diffusion). For an evaluation of strengths and limitations of these indices see Firmialy and Nainggolan (2018).

Dow Jones Sustainability Indices (DJSI)

The first sustainability index calculated by the Dow Jones was launched in 1999. Today, DJSI is a family of several indices that assess economic, environmental, and social performance of companies stratified by industry. Indices refer to different geographical areas: DJSI World (subdivided into World, World enlarged, Emerging Markets), DJSI Regions (Asia, Europe, North America), and DJSI Countries. Every year the largest companies (in terms of float-adjusted market capitalization) are asked to respond to an extensive industry-specific questionnaire prepared by RobecoSAM, a specialist in sustainability investing that partners with DJ to perform the sustainability assessment and calculate the Total Sustainability Score (TSS) for each company. When a selected company does not respond to the questionnaire, the score is calculated through the use of publically available information. In addition, the score is integrated with public information (e.g., media and stakeholder commentaries) to check for crises situations and ESG risks that may have a damaging effect on a company’s reputation and business. Companies operating in alcohol, tobacco, gambling, armaments, adult entertainment, nuclear weapons, and nuclear power generation industries are excluded for ethical reasons.

For additional information: <https://www.robecosam.com/csa/indices/?r>

FTSE4Good Index Series

FTSE4Good is also an index series like the DJSI. It was launched in 2001 and scrutinizes company by geographical areas. In this case, the provider of stock market indices (both sustainable and traditional indices) is the FTSE Group, owned by the London Stock Exchange. Companies are included in the FTSE4Good based on the ESG rating assigned by one company of the group named FTSE Russell, which exclusively uses public

information of over 4,000 companies in 47 different financial markets. Its peculiarity is that it does not accept data or information privately provided by companies as this is held to improve the credibility of data and enhance transparency across the market. The index excludes companies due to their involvement in tobacco production, nuclear weapons, conventional weapon systems, or coal power industry.

For additional information: <https://www.ftserussell.com/products/indices/ftse4good>

STOXX® ESG Indices

STOXX provides ESG-screened versions of more than 40 benchmarks that meet the standard responsible-investing criteria of leading asset owners. Also in this case, there is a family of indices, including the ESG-version of global, regional, and emerging markets benchmarks (e.g., Stoxx Europe 50 ESG; Stoxx Australia 150 ESG; Stoxx Emerging markets 50 ESG). The screening is made by Sustainalytics. It excludes all companies that are not compliant with the UN Global Compact principles and companies involved in nonethical industries such as tobacco producers and manufactures of nuclear and chemical weapons. The most known index is the STOXX® Global ESG Leaders index that includes the world's leading companies in terms of ESG criteria. Then, there are other subindices referring to different ESG areas, like the STOXX® Global ESG Environmental Leaders and STOXX® Global ESG Social Leaders.

For additional information: <https://www.stoxx.com/index-details?symbol=SXWESGP>

MSCI ESG Indexes

Based on the annual analysis of ESG aspects of over 13,000 companies (stock issuers including subsidiaries), MSCI ESG Research LLC examines and rates organizations worldwide. Evaluations on ESG risks associated to the examined companies are offered to asset managers, asset owners, and banks. Ratings are expressed with letters (AAA, AA, A, BBB, etc.) and provide institutional investors looking for companies with high sustainability performance with the information needed to build their portfolio.

Ratings are then used to calculate the MSCI indexes, which are subdivided in different classes, each representing a main ESG strategy. For example, with reference to environmental aspects, there is an MSCI Climate Change Index that measures opportunities and risks associated with the transition to a low carbon economy and the MSCI Global Environment Index that includes securities of companies that derive at least 50% of their revenues from environmentally beneficial products and services like alternative energy, green building, or clean technology.

For additional information: <https://www.msci.com/esg-indexes>

Vigeo Eiris Indices

Vigeo Eiris is a rating company that manages a family of ESG indices, published on financial platforms such as Bloomberg and Datastream. They perform ESG research on about 4500 issuers and thematic research covering up to 10,000 issuers. The most famous is the Euronext Vigeo Eiris indices family, which refers to the highest-ranking listed European companies according to their ESG performance. Then, it also calculates the Ethibel Sustainability Indices (ESI), the Vigeo Eiris Best Emerging Market (EM) Performers ranking, and the CAC 40® Governance index, which is a thematic index focusing on companies' performance in terms of responsible corporate governance. Company assessment is based on an exclusive methodology (a framework of 38 sustainability criteria grouped into six domains) and also includes the analysis of any disputes.

For additional information: <http://vigeo-eiris.com/>

CDP "Climate Change A List"

CDP is a not-for-profit charity that ranks companies and cities based on environmental aspects only. It makes an annual company assessment (over 7000 participating companies in 2018) for the advanced approach to climate change mitigation. The best performing companies (around 140 companies) are included in the "Climate A List" that was established in 2011. The analysis is based on data and information provided by companies, which are evaluated on four

successive levels (communication, awareness, management, leadership) that represent the phases that a company goes through progressing toward environmental protection. Businesses receive a score from A to D–. F is given when a company requested to disclose its data and fail to do so.

For additional information: <https://www.cdp.net/en>

Standard Ethics Rating and Indices

Standard Ethics is an independent sustainability reporting rating agency that introduced in 2001 a standardized approach to sustainability ratings. From a methodological point of view, it separates Corporate Social Responsibility (CSR) from Sustainability, and its Standard Ethics Rating is an evaluation of the level of compliance of companies and sovereign nations on matters such as corporate governance and sustainability as indicated by documents and guidelines published by the United Nations (UN), the Organization for Economic Co-operation and Development (OECD), and the European Union (EU). Its business model is peculiar as it sells solicited ratings (i.e., upon a client's request, the company issues a rating that stems from a direct and regulated bilateral relationship). It does not provide consultancy services, does not sell services to investors, nor does it use the data collected for asset management activities.

Standard Ethics has created several indices subdivided by geographical areas (e.g., Standard Ethics European 100; Standard Ethics UK, Italian, French). Its indices are totally "Open Free," which means that the indices are freely usable as a benchmark in CSR and SRI.

Use of Sustainability Stock Indices in Academic Research

The presence of a company on a sustainability stock index or some ESG-related ratings helps to communicate higher standards for CSR. Hence, several studies use the inclusion or exclusion of companies in sustainability indices as signal or

proxy for CSR performance to then test hypothesis that link the impact of CSR performance on company's financial value.

For example, Adamska and Dabrowski (2016) demonstrate that the exclusion of Polish listed companies from the ethical RESPECT Index is taken into account by investors and consequently affects the rate of return on their shares. Similarly, Becchetti et al. (2012) reveal a significant market reaction to corporate exit from the Domini 400 Social Index, recognized as a CSR benchmark, between 1990 and 2004. Inclusion in a social index generates a strong positive stock market reaction regardless of whether the rating is good or bad (Cellier and Chollet 2016). Yet, market reaction is temporary. As demonstrated by Cheung (2011), addition or deletion from the Dow Jones Sustainability World Index generates a significant increase (decrease) in stock return but only on the day of change. Nevertheless, being listed in corporate sustainability indices remains a distinctive mark and research has demonstrated that companies included in such indices have higher price-to-book when compared to companies not listed (Carvalho and Tavares 2013). Testing whether the stock market values the inclusion/exclusion in a sustainability stock index is usually made recurring to event study analysis (Oberndorfer et al. 2013; Aureli et al. 2019) or adopting the Feltham and Ohlson (1995) valuation model as demonstrated by Kaspereit and Lopatta (2016).

Another stream of research refers to the reactions of evaluated companies. Inclusion, exclusion, or changes in CSR ratings should also motivate companies to adjust their behavior based on how they rank. However, Scalet and Kelly (2010) found that being dropped from a CSR ranking does not push firms to acknowledge and address problems related to their social and environmental performance.

Corporate Sustainable Innovation

Maria Roszkowska-Menkes
Department of Management Theory, SGH
Warsaw School of Economics, Warsaw, Poland
Marketing, Management and Entrepreneurship,
University of Scranton, Scranton, PA, USA

Synonyms

Corporate social innovation; Eco-innovation; Ecological innovation; Environmental innovation; Green innovation

Definition

Corporate sustainable innovation (see also ► [“Sustainable Innovation”](#)) seeks to simultaneously solve environmental and social problems and generate profits for the company (Delmas and Pekovic 2018). Its nature can be technological, organizational, social, or institutional (Rennings 2000).

In a narrow sense, corporate sustainable innovation can be defined as “new ideas, behavior, products and processes, (...) which contribute to a reduction of environmental burdens or to ecologically specified sustainability targets” (Rennings 2000, p. 322). In this sense sustainable innovation is often used interchangeably with notions “ecological” or simply “eco-innovation,” “environmental innovation,” and “green innovation.”

In its original, broader meaning, the term includes also a social dimension in addition to the environmental one (Schiederig et al. 2012). In a broader sense, including both social and ecological aspects, it is used synonymously with corporate social innovation (CSI) (Kanter 1999) (see ► [“Innovation and CSR”](#)).

Elements of Corporate Sustainable Innovation

Corporate sustainable innovation can be characterized by six elements (Schiederig et al. 2012):

1. Innovation object: product, process, service, and method
2. Market orientation: competitive advantage through user need satisfaction
3. Environmental/social aspect: reduction of negative or generation of positive environmental/social impact
4. Phase: full life cycle considered
5. Impulse: economical or ecological/social motivation
6. Degree of newness: firm level

The first two are defining elements of innovation in general, describing different innovation

objects (product, process, service, or method) and its main function, which is to satisfy user’s need and therefore be competitive on the market. The third element indicates that sustainable innovation seeks to reduce negative or generate positive social and/or environmental impact. This element is of relative and temporary nature, as it requires the comparison to existing intra- or interorganizational alternatives. The fourth aspect illustrates that the analysis of innovation’s environmental and social impact should be conducted for a full life cycle and for all input and output factors. Fifth, the motivation of the innovator to introduce sustainable solution may be economical or related to social mission. Finally, the last element suggests that a sustainable solution needs to be at least new to the innovating company in order to be classified as a sustainable innovation.

Innovation as a Driver of Corporate Sustainability

Since corporate sustainable innovation provides a public good by addressing social and environmental needs, its relationship with competitive advantage is even more uncertain than with typical commercial innovation. For this reason sustainable innovation has for long been underinvested (Delmas and Pekovic 2018). However, as global sustainability pressures change the competitive landscape, companies are being forced to innovate in this area (Nidumolu et al. 2009).

Innovation is perceived as the key to achieving the needed, strategic corporate sustainability that enables companies to meet stakeholder expectations and match the scale and urgency of the global problems without sacrificing their growth ambitions (Visser 2012; Osburg 2013). Corporate sustainable innovations of products, services, processes, as well as whole business models, help companies to tackle the root causes of their present irresponsibility and meaningfully contribute to sustainable development (Visser and Kymal 2014), by creating shared value (CSV) (Porter and Kramer 2011) (see ► [“Porter and Kramer’s \(2006\) “Shared Value”](#)”) or integrated value

(Visser 2018). While the first refers to “practices that enhance the competitiveness of a company while simultaneously advancing social and economic conditions in the communities in which it operates” (Porter and Kramer 2011, p. 6), the latter stands for “the simultaneous building of multiple capitals (notably financial, infrastructural, technological, human, social and ecological) through synergistic [and disruptive] innovation” (Visser 2018, p. 132).

There are five pathways for corporate sustainable innovation (Visser 2018):

1. Secure – innovation that helps communities prepare for and respond to emergencies and crises, for instance, solutions related to occupational health and safety, insurance cover, and emergency preparedness
2. Smart – use of technology to better connect citizens/customers to each other and allow them to access knowledge, share information, and give direct, immediate feedback
3. Shared – solutions that address issues of equity, access, diversity, and stakeholder participation
4. Sustainable (in narrower, ecological meaning) – innovation that enables shift to renewable energy and resources, closing the loop on production and moving to a low carbon society
5. Satisfying – high-quality services that satisfy human needs and promote well-being

Sustainable Business Model Innovation (See ► **“Sustainable Business Model Innovation”**)

Corporate sustainability is achieved not only through innovation in technologies, products, or services but also through business model innovation (Yang et al. 2017). Technology always needs suitable business models to achieve its commercial potential (Chesbrough 2007). Additionally, while technology innovation is limited to a specific industry, business model innovation is more generic and can be applied by organizations from various industries (Teece 2010) and in result has greater potential to be scaled up. Business model innovations have the potential to bridge the gap

between radical and systemic sustainable innovation and firm strategies, including the issue of economic performance at several levels (Boons and Lüdeke-Freund 2013). Thus corporate sustainable innovation within business models is discussed as major factor that can support the adoption of cleaner products and processes, sustainable supply chains, and further contributions to a transition toward sustainable consumption and production (Tukker et al. 2008).

Company

Definition/Description

The corporation is a legal concept found in most legal systems around the world (Stout et al. 2016). Its three main features are first, its independent existence, which allows it to operate within the legal system, entering into contracts and holding property, without engaging liabilities for the human people involved in those activities. Second, the corporation has perpetual existence which allows it to continue to exist regardless of the human people who may come and go in terms of its operations and participation. Third, the corporation operates through some type of formal management often known as directors and has members. As a concept, it has been part of western legal systems for about a thousand years.

Corporations are the preferred organizational form for businesses. They provide a number of advantages to those operating the business. Unlike partnerships or sole proprietorships, corporations allow limited liability for investors and agents, the pooling of resources, continual existence, and significant in terms of sustainability, uncompensated externalities such as pollution (Sheehy 2004a).

The term “corporation” or “corporate” is often misused. For example, it is often equated with the idea of business enterprise. A business enterprise may be composed of many corporations, in different relationships from partnerships and joint ventures to various types of relationships depending on shareholdings and hierarchies. For example, a corporation may be a parent company of one company while being a subsidiary of another. Another common misuse of the term corporate is found in its use as an adjective describing behaviors, protocols, or incentives. For example, “corporate dress” means dressing style appropriate for professional workplaces.

Introduction

The corporation is a legal idea with a long history in the Western tradition. Some scholars see it as stemming from the grave cults of ancient Greece

where a wealthy person would bestow assets on a group of people who would use those assets to keep the person's memory alive after his/her death. The modern corporation comes from the middle ages where a revival of Roman law brought the idea back to life and introduced it to Western legal traditions.

As it developed and its utility became clearer, the corporation became the preferred vehicle for business organizations. The modern business corporation is controlled by directors and has as its members, the shareholders.

There are a variety of models and understandings of the corporation. These come from the corporation's historical development, economics, and organization theory. These theories range from concession theories to economic theories of mere contracting to more robust models of socially embedded organizations with active hierarchies involved.

Corporation in the Legal System

The corporation is a concept, a creation of the legal system (Maitland 1893). It is a legal category and a grouping of rights and duties that form an actor or placeholder within the legal system. For legal purposes, the corporation is a fully formed person freely able to navigate the legal system. It can enter into contracts. It can hold property. It can sue people. It can be sued by people. It must pay taxes just like any other person. In fact, the corporation is properly referred to as a "legal person" and "artificial person" in contrast to a "human person" (Stout et al. 2016). It is referred to as a legal person because it has been created by the legal system. It is referred to as an artificial person because it is not a natural person born into the human race. Rather, it is a creation of the legal system and recognized within this system as the equivalent of a human person. Thus, this use of the term person helps understand how the legal system treats corporations.

Corporations are of many types. Not all corporations are used for business. For example, the City of London is a corporation as is the monarch

of the United Kingdom. Most universities are corporations as are many charities. Corporations that are used for business are referred to as "companies."

Corporations and companies, having their own existence within the legal system, do not depend for their existence on the people who may operate them. Those people occupy positions within these corporations but are distinct from the corporations themselves. This distinction is perhaps the most critical aspect of corporate theory but often the most difficult concept for people to understand (Sheehy 2016).

Corporate Creation and Organs

The corporation is created by filling an application form and registering it with the appropriate authority. Once it is registered, the authority declares it as a corporation, fully formed upon registration. The application form will include information about the parties to be involved. In a two-tiered system, the persons involved will be the directors and members. The directors form a board of directors while the members are not necessarily so organized. Together they form the corporate organs (Stout et al. 2016). In a dualistic board model, more common in civil law jurisdictions, the two boards – the board of directors and the board of advisors (at times composed of labor representatives) – will be considered organs. Where the corporation is a company limited by shares, the members of the company are referred to as shareholders.

The registration document will also refer to some type of corporate constitution – an internal rule system which constitutes the corporation providing for the organs and other rules. These rules may be supplied by the state or by the parties registering the corporation itself. The internal rules provide the basis of the governance of the corporation – who has what powers. These powers are divided between the board of directors and the members, with management powers usually granted to the directors.

Directors Duties

The main legal control on directors' powers is through a set of legal duties called "directors' duties." These duties, broadly speaking, require the directors to place the interests of the corporation ahead of their own personal interests. These duties can be thought of as creating a duty to look after the corporation as one would look after any other party in a relationship of dependency – a relationship known in law as a fiduciary relationship. While not all of the duties are fiduciary, most jurisdictions have an element of fiduciary obligation (Dalley 2001). Contrary to some business scholars, law does not require directors to focus on maximising shareholder value and ignore Corporate Social Responsibility (Sheehy and Feaver 2014).

Corporations, Sustainability, and Corporate Social Responsibility

Corporations are deeply implicated in the environmental crisis that the sustainability agenda aims to address (Sjåfjell and Bruner 2020). As legal actors with no agenda but wealth accumulation and as providing a shield for human persons who control it, the corporation is an ultimate vehicle for the exploitation of the natural environment (Sjåfjell et al. 2015). It throws off social costs while internalizing the profits generated by the activity (Sheehy 2004a).

Social Costs and Sustainability

Corporations, although artificial legal actors, have real-world effects. The reason they can do so is that they are able to hold property and enter into contracts for services. The result is that they are able to own and operate fossil fuel resources such as coal mines and oil fields, transportation services from airlines to cargo ships, and energy generation plants, all of which emit great amounts of greenhouse gases. Unlike human persons who might pause a moment to think about the consequences of their actions, legal persons have no

such desire. Companies are focused primarily on profit.

Companies lack incentives to pay for the costs of their pollution and the services they receive from the environment. Where governments have not imposed regulations on companies to compensate for these costs placed onto the public, they are free to do so allowing them to generate public, social costs while keeping the profits private for the shareholder members (Sheehy 2004a).

Directors Duties and Corporate Social Responsibility

Corporate social responsibility is an effort to limit the harms and distribute more widely the benefits of the corporation (Sheehy 2015). It is a form of private regulation. Some scholars take the position that directors are not permitted by law to spend money on matters that do not generate immediate shareholder benefit. Some finance scholars, for example, argue that the law requires directors to limit their discretion to wealth creation. This position is incorrect. The law grants directors wide discretion allowing them to invest the corporation's funds in any way that they believe will advance the interests of the corporation (Sheehy and Feaver 2014). A fundamental consideration is that directors do not have a legal duty to shareholders but to the corporation and that it is often not clear what the precise consequences of any investment of resources will be. Accordingly, a director's decision to invest in corporate social responsibility fits well within the scope of director discretion.

Theories of the Corporation: Understanding the Corporation

The corporation, as a legal construct with ramifications in other aspects of social life, is explained using a variety of models. These models have different focal points and provide different insights (Sheehy 2004b). Historical models of the corporation, a concession theory, reflect the privileged status of the corporation. It was a grant

or concession from the crown and often associated with a franchised monopoly, such as the East India Company. Later developments in the law allowed access to the corporation, as noted, through the mere application, and as a result, this concession model of the corporation has declined.

Some models have equated the company with the shareholders, and indeed, this position has been adopted by modern finance as providing the corporation's objective function (Jensen 2001). This position, while correct in certain instances, in many cases is incorrect. One problem with the model is that there is no single type of shareholder which can provide clarity on which decision to take. Some shareholders may be pursuing income while others are interested in capital gains. Still more troubling about this model is that the majority of shares traded on the large stock markets are held for a matter of seconds. It is difficult, if not impossible, to make decisions on the basis of the interest of these shareholders (Hu 1994).

A common theory following the era of the concession theory was the aggregate theory of the corporation. This theory viewed the corporation as no more humans collaborating and pursuing their collective interests via private contracts between members and directors, associated or aggregated together, forming a particular group. This view shifted the corporation from the public arena of the concession theory to the private arena which properly excluded government interference and public interest (Buxbaum 1984).

Economic models of the corporation focus not on the legal person (Bratton 1989) but on the concentrated economic activity that the corporate form generates (Bratton 1989). From an economic perspective, the corporation appears as little more than a location in a market with a higher density of contracting. There are parties internal to the corporation contracting – directors and shareholders – and parties external to the corporation contracting with it. These contracts may be for goods or services, both supplying and purchasing from the legal person. The state merely provides the default contract rules and nothing more (Easterbrook and Fischel 1991).

As analysts committed to the institution of markets, economic models see the corporation as operating within four markets which serve to constrain corporate behavior. These markets are the markets for finance, products, corporate control, and executive talent (Coffee 1984). These markets, combined with the default rules, the standard contractual terms provided by the state as a corporate constitution, provide the two-part economic regulatory model for the corporation.

Organizational models of the corporation explain it as a social actor, a marker of social space with an internal hierarchy focused on collaborative production. It attempts to understand the complexity of internal relationships beyond the highly stylized director-member dyad and into the live, dynamic relationships of people with different information, roles, and personalities. It also recognizes the corporation as a significant political and social actor (Bottomley 2007). Corporations lobby politicians for regulation favoring their own interests.

Corporate Reform

A core issue for corporate theorists is whether the corporation should be considered a public or a private matter. Given the overly large role of corporations in society – they employ the majority of the workforce in most developed economies and own the majority of assets – there is good reason to hold them to be public bodies. Nevertheless, they are set up and operated by parties acting in their private capacity, with private resources to pursue private ends.

Kent Greenfield points out that although the corporation is a unique creation of law it should not be founded on different principles. He argues that (1) the ultimate purpose of corporations should be to serve the interests of society as a whole, (2) corporations are distinctively able to contribute to the society goods by creating financial prosperity, (3) corporate law should further principles 1 and 2, (4) a corporation's wealth should be shared fairly among those who contribute to its creation, and (5) participatory, democratic corporate governance is the best way to

ensure the sustainable creation and equitable distribution of corporate wealth (Greenfield 2005). These principles, he argues, are more consistent with law as a whole. The legal system was created for public benefit. Accordingly, rebalancing the legal system's own creation to reflect that bias is more appropriate.

Summary

Corporations are legal entities or legal persons, distinct from the people who direct them or are members. They act in their own right and capacity. As such, they are able to pursue their own agendas single-mindedly without reference to other social actors and their constraints. Corporations are composed of directors and members (and in civil law jurisdictions, often a supervisory board). They are not required by law to advance the wealth of shareholders.

Corporations present a deep challenge for sustainability because they aggregate resources and use them to exploit the planet's social and environmental riches for private profit. Further, they do so with little regard for the ecology. Corporate social responsibility is one way in which parties have collaborated in efforts to reduce the harms generated by the corporate form.

Various understandings of the corporation provide insight into different aspects of the corporation. These theories are informative but contradictory among themselves.

Corruption

Adriana Burlea-Schiopoiu
Management, Marketing, Business
Administration, University of Craiova, Craiova,
Dolj, Romania

Synonyms

Bribery; Exploitation; Fraud; Malfeasance; Misconduct; Skimming

Definition

Corruption is a ubiquitous and intentional phenomenon that directly affects the national security, performance, and ethical values of people, organizations, corporations, governments, and communities. Moreover, it is difficult to choose one definition of corruption because there are many definitions in the literature, and each international organization has its definition depending on its mission. For this reason, we define corruption as an omnipresent phenomenon related to the human survival instinct that negatively affects communities, organizations, and countries.

Based on the definition of the dispersal of responsibilities as a phenomenon that “is generated by a misunderstanding of autonomy and self-governance and represents a motivation for managers to promote non-virtuous beliefs”

(Burlea-Schiopoiu and Idowu 2016, p. 152), corruption can be considered as a lack of virtue of individuals and/or groups.

Therefore, corruption will not disappear, and humanity must aim to reduce this negative phenomenon and bring it to a level of affordability by acting on reducing the rapacity of individuals and organizations.

Introduction

The twenty-first century has been marked by many civil societies’ struggles against corruption (the Middle East and North Africa was involved at the end of 2010 and the beginning of 2011 in the Arab Spring Revolution; in January 2011, Tunisia was the theater of Jasmine Revolution; and following Tunisia, in 2011, the Yemeni Revolution of Dignity started; November 21, 2013, was the starting point of Maidan Revolution in Ukraine).

Nowadays, we are confronted with two corruption paradoxes because as much corruption is analyzed and structured. The more measurement indicators and anti-corruption methods are developed, the more this phenomenon acquires new dimensions and develops, even in those countries where democracy is considered high.

Unfortunately, the legitimacy of law enforcement is still weak and continuously diminishes the trust of people in national and international institutions.

The second paradox refers to the crisis as the foundation of corruption. In times of crisis (economic, financial, pandemic, political), corruption finds the environment conducive to development.

Although it is a global phenomenon, corruption requires timely solutions depending on national and regional particularities.

Although greed is the source of any phenomenon of corruption, the way individuals act is different because they rely on different laws. The dispersal of responsibilities phenomenon can be considered a facilitator of corruption (Burlea-Schiopoiu and Idowu 2016; Burlea-Schiopoiu and Remme 2017).

Therefore, Burlea-Schiopoiu and Idowu (2016, p. 161) affirm, “The corruption is seen as second nature to the business organisation and this phenomenon negatively impacts managers’ virtuous beliefs and the flourishing of community.”

The relationship between DR and corruption is obvious, especially if we start from the definition of DR as a complex phenomenon that acts on many different levels of influence (e.g., economic, social, legal) and supplies irresponsible organizations with tools for illegal and unethical actions.

The Features of Corruption

The events from the last years (i.e., the COVID-19 crisis and international conflicts such as the Russian-Ukrainian war) proved that the international legislation rules and norms are not considered and, indirectly, they contribute to the manifestation of corruption.

In times of crisis, dispersal of responsibilities is the process that promotes corruption by providing tools that facilitate the manifestation of unethical behavior of individuals in a position to make decisions.

Civil society should become more decisive and more responsible so that, through its voice, it can make governments more and more accountable, promote inclusive politics, and contribute to the development of open economies.

In order to become strong, civil society must promote its values and punish its leaders for defending its promoted values and preventing acts of corruption that affect their standard of living and moral integrity.

Mass media plays an essential role in the fight against corruption and in promoting democracy, but sometimes the mass media itself is corrupted and enslaved to the interests of moguls (Johnston 2009).

Johnston (2009) considered that official moguls is one of the four corruption syndromes, influence markets, oligarchs and clans, and elite cartels.

The level of corruption and leadership, especially political leadership, makes the difference between democratic and not democratic countries,

between developed and underdeveloped countries, and between safe and unsafe countries.

Around the world are many examples that prove the relationship between corruption and the quality of life of the people (Gillanders and van der Werff 2022; Mugellinni and Villeneuve 2019). In order to reduce their vulnerability, civil society and mass media fight corruption, are proactive, and promote servant leadership that puts above public interests and not private interests.

The Complexity of Corruption

Corruption also manifests itself at the level of international bodies created to fight corruption (i.e., Benon Sevan, the former head of the United Nation’s oil-for-food program in Iraq).

Former presidents of democratic countries were convicted of corruption.

Recent examples are as follows: former Frenchman Nicolas Sarkozy received a custodial sentence – for corruption and influence. Finally, he was sentenced to a year in prison for illegally funding his 2012 reelection campaign; former South Korean President Lee Myung-bak was sent to prison for 17 years for bribery and embezzlement charges.

At the international level, many bodies are involved in the fight against corruption (i.e., the European Union, International Monetary Fund, Organization for Economic Co-operation and Development, Transparency International, United Nations, World Bank, World Trade Organization) which is both strong and weak points that favor dispersal of responsibility. International bodies fighting corruption must establish a joint and concerted strategy involving a common mission (fight against corruption) and detection mechanisms, measurement indicators, and joint sanctions.

Many factors positively or negatively influence corruption as a controversial phenomenon (Fig. 1).

The dispersal of responsibilities, legislation, leadership, and public policies positively influence corruption and can contribute to the development of unethical behavior.

Corruption, Fig. 1 The factors that influence the corruption

Legend: —————> Positive influence on Corruption
 - - - - -> Negative influence on Corruption

The dispersal of responsibilities by definition positively influences corruption because, as a complex system, it encompasses both the shortcomings of the legislation that creates the possibility of preferential interpretation of sanctions and the weaknesses of leadership and public policies that favor bribery.

Transparency and sustainability reduce corruption by eliminating the mechanisms that motivate individuals and organizations to promote unethical behavior (Hung et al. 2018).

Sanctions and control do not work if they are not correlated with an effective anti-corruption strategy, a strategy that must be reconfigured at very short intervals in order not to give the possibility of a corruption phenomenon perpetuating.

Profit for companies and material and financial gains for individuals are motivating factors for corruption. Therefore, the fight against corruption must create and implement mechanisms to discourage corruption for both individuals and organizations.

Actions to reduce corruption are aimed at both individuals and public and private organizations and include:

- Reducing bureaucracy.
- Digitization of the activity of public institutions.
- Developing financial mechanisms to improve the transparency of the way public funds are used.
- Inclusion in the integrated reports of the companies of some indicators that reveal the stakeholders' possible risks of corruption.
- Improving reputation and legitimacy by ensuring access to information for stakeholders.
- Reducing the exposure of individuals to actions that involve a particular risk of corruption, in parallel with the tightening of sanctions.
- Development of anti-corruption strategies and implementation of concrete action plans to continuously monitor the progress of the fight against corruption.

Corruption and Terrorism

Why are terrorist organizations and extremist groups so popular among people worldwide?

The answer is related to corruption because people no longer support corruption in political systems and want change to punish corrupt leaders.

The people are tired of fighting for democracy and against corrupt political leaders whose decisions affect their daily living standards and turn to extremist groups that they consider a viable alternative to corrupt governments, considering them capable of reducing corruption and promoting fair justice.

These organizations take advantage of people's dissatisfaction and act on civil society through psychological mechanisms, condemning corruption and presenting violence as a means of salvation and not repression.

Leaders of terrorist organizations promote violence as the most effective and legitimate tool to eradicate government-level corruption and punish corrupt politicians and civil servants.

In a democratic state, civil society has the right to elect its leaders and campaign to reduce corruption, but recent events underscore the importance of the fight against corruption regardless of the level of democracy in society.

Conclusion on the Perennially Corruption

Analyzing the history, sources, and motivational factors of corruption leads us to conclude that this phenomenon cannot be eradicated, but action can be taken to reduce it.

Corruption does not follow a particular political, national, regional, or cultural pattern because it manifests itself based on the mechanism of supply and demand. Therefore, anti-corruption actions must be focused on both supply and demand. Most anti-corruption sanctions have focused on "demand," with "supply" being held accountable and responsible for creating opportunities for corruption as it meets "demand."

Summary

Corruption continues to be a negative phenomenon at every level of organizations and society.

A new approach to corruption should be oriented to diminish it in correlation with the dispersal of responsibilities. The strong correlation between corruption and the dispersal of responsibilities promotes the confidence of leaders and managers in their unlimited power.

Paradoxically, unlimited power motivates people to promote corruption as a sign of their position in an organization or society.

Synonyms

Corruption; Public sector; Transparency; Transparency International

Definition

Corruption Perception Index (CPI) is measured annually by Transparency International, an organization created in 1993 with the aim of putting an end to corruption and promoting transparency. In accordance with this mission, the organization started to measure and publish Corruption Perception Index in 1995 as an indicator for corruption in the public sector. The research started with 41 countries in 1995, and now it sums data from 180 countries in the world. This constitutes an important progress in terms of transparency, contributing to a cleaner world and less corruption. When people have the information regarding issues like corruption and bribery, they become more prone to respecting the law and be good citizens. We can make comparisons between countries and understand the connection between this index and their wealth. If at the beginning the data were only some numbers in a document, with time and the evolution of the Internet and globalization, there came more benefits: data presented in a more graphic way, easy to understand and share, more details regarding each country in the study, the opportunity to compare data with those from previous years and see the evolution of a country or a region, and the possibility for everyone to download and share different resources provided by the Transparency International (summary, social media kit, regional results, global infographic, and others).

Introduction

The Transparency International is an NGO fighting against corruption and helping governments to manage this matter seen in many cases still as a taboo. Nowadays, the organization is present in almost 100 countries and is mostly known for measuring and publishing the Corruption Perception Index. As the name of this index states it, it measures the perceptions of the public on corruption because it is difficult to have a full image on the real corruption. We can only imagine the depth of the phenomenon in some countries. This does not mean that clean countries do not have corruption or that a bad score means everything is bad related to this aspect. But in perspective, we can have a clearer image on a country's background and transparency analyzing the data on the CPI of a country during several years. The main aim of fighting corruption was related to that of fighting poverty and helping poorer communities in having a chance to development. Corruption is an important risk that leads to an increased gap between countries' level of development.

Methodology for Calculating CPI

The Corruption Perception Index is according to the Transparency International Secretariat (2017) "independent, non-political and non-partisan." The methodology for its calculation is presented on the website in different languages, in a short version (Transparency International 2015a) and a more detailed and technical one. There are four steps that are ensuring a high level of reliability for the index and reduce the subjectivity: selecting the data sources (12 sources from 11 institutions) regarding the perception on corruption in the past 2 years; adjusting the scores in the data sources to the 0–100 scale where 0 is the most corrupt and 100 the cleanest country; calculating the average score for a country; and reporting the uncertainty and the standard error of CPI. In order to be included on the list of the countries for which the organization measures the CPI, there should be at least three data sources available that present data regarding the corruption in that country.

Impact

Even if CPI might seem just a number, the Transparency International had an important impact in the community, helping people take a stand and making it difficult for governments and officials to ignore the problem. According to the website of the Transparency International (www.transparency.org/news/story/hidden_costs), they contributed to the saving of two billion dollars in Czech Republic when a whistleblower reported corruption regarding the bidding process on cleaning waste and pollution in the country. The costs were overestimated. The result was that the bidding process started over and the government introduced changes in the procurement legislation.

The Transparency International (2015b) published a report on the impact made in the world of fighting corruption. They mention some important conventions against corruption they fought off (UN Convention Against Corruption from 2003, 176 countries being part of the convention, OECD Anti-Bribery Convention from 1997 banning international bribery that was previously even deductible in some countries). Other results include benchmarking good businesses and establishing a high standard for integrity, contributing to the 10th principle of anti-corruption in the UN Global Compact followed by 8000 companies that are socially responsible, including good governance in the Sustainable Development Goals since 2015, keeping climate finance clean (the case of Czech Republic is presented as an example), making public money transparent (not using public money for private matters; there are presented examples from Palestine, Pakistan, Honduras), encouraging people to speak up for their rights and freedom, offering expertise for creating a law for the right to information, and creating leaders at the summer schools organized by the Transparency International. All these efforts were successful because simple citizens, governments, and officials from all over the world trusted and supported the Transparency International in fighting for justice and integrity.

Solutions for Increasing CPI

People can get involved in the Transparency International activities in reporting corruption to Advocacy and Legal Advice Centres (ALACs) present in more than 60 countries. Since 2003 when the first center was opened, more than 200,000 people contacted them. CPI is based on the experts' opinions and targets the public sector corruption. The link between corruption in a country and the bad score of CPI is also a sign of the deterioration of other aspects in the country (poverty, unmet needs of the citizens, biased media, conflicts, unemployment, poor public services, a general lack of trust, lack of investors, lack of productivity).

Considering these consequences and implications of the phenomenon of corruption, citizens and governments should take serious measures to counter the effects of corruption and reduce the extent of the phenomenon, thus contributing to an increase of CPI. The solutions presented by the Transparency International (www.transparency.org/getinvolved) are contacting the Transparency International from your country, the EU Liaison Office, or the Transparency International Secretariat; if you witness an act of corruption, you can contact ALACs; other ways include joining anti-corruption global campaigns and global photo competitions, nominating a hero that fights against corruption for receiving an anti-corruption award, spreading the word, and sharing the banners of the Transparency International dedicated to this fight.

All these are ways in which simple individuals can make a difference in the community. There are numerous small acts of corruption accepted as a norm in many countries, because people got used to this reality. If you want a cleaner country, you have to start with you. Maybe just a small change is not so important for the big picture, but if you make lots of small changes, that will make an impact in the community, and in the long term the score of the CPI will increase.

Limitations of CPI

Thompson and Shah (2005, p. 7) mention the important bias included in the scores that stay at the foundation of calculating the CPI. They considered that “it is not clear that averaging these measures leads to greater accuracy.” Other limits they mentioned for the CPI are that averages of different aspects of corruption are not always comparable, the opinions of the experts are subjective, and there are some technical issues regarding the large standard error. Brown, Orme, and Roca (2010) consider that perception on corruption can be influenced in a great extent by media, thus influencing the way CPI is calculated. The authors use the term media or reflective bias. They, as Thompson and Shah, also question the experts’ assessments on corruption, considering them as biased or not fully aware of the reality in a country. In my opinion, these are just limitations we should consider, but we do not have to fall in the trap of considering CPI as a bad thing. Maybe the score is not always very accurate, but definitely there is something there about the corruption in a country. It is hard to believe that a country is clean and the score of CPI shows differently or vice versa. Roca and Alidedeoglu-Buchner (2010) continue the previous research showing that CPI is under a reflective bias and should be used cautiously especially in authoritarian countries where “corruption is probably underestimated.”

Madiche (2005) considers that CPI might also be seen a cause for a continuous bad image of country. The author appreciates that one of the problems of Nigeria in the twenty-first century is the bad image maintained also by this score; practically there is a label stuck with the country, and progress is difficult to make. This should be taken into consideration, but the results and the impact of the Transparency International’s activity cannot be denied. There are countries that evolved and improved their score and their image. Rohwer (2009) from Ifo Institute for Economic Research at the University of Munich also puts under the question the accuracy of the Transparency International’s Corruption Perception Index and the World Bank’s Worldwide Governance Indicators, appreciating they should be used cautiously because of the way they are constructed. The author highlights

the importance of stating that these are measuring perceptions of corruption, and not corruption like what CPI states in its name.

Summary

As Rohwer (2009) states, the importance of indexes like CPI is clear because they lead to other initiatives that are more accurate and transparent like the Transparency International’s Global Corruption Barometer that summarizes perceptions and experiences of the general public regarding the different aspects of corruption in a country. Wickberg (2013) from the Transparency International presents the strengths of CPI (includes numerous countries, is based on various data sources, has an important role for advocacy groups) and also its weaknesses (not making a difference between the types of corruption, lack in accuracy of perceptions, being too subjective). Soreide (2005) emphasizes the risks brought by not using correctly a score like CPI and appreciates that the CPI would increase “by creating incentives for states to improve their achievements on the OECD anti-bribery convention.”

There is no doubt that there are numerous limitations of the CPI in the way it is constructed or used, but we cannot deny its impact and its role in the world. People are becoming more aware of the corruption in their countries and are not willing to close their eyes anymore. Even if corruption is hard to be measured, CPI can be an indicator for what is happening in a country at least in a broader sense. The progress made by the Transparency International, the number of countries where they are present, and the high number of people that contacted their ALACs (more than 200,000) show us the need for having an international organization where citizens can report corruption acts. Of course, there were, are, and always will be critiques regarding CPI, but this is in fact good because it helps the Transparency International to improve its methodology for calculating CPI, and this happened in the past. Nowadays, the methodology is more transparent, and there are numerous press releases in various languages, thus contributing to the awareness regarding corruption and the need for fighting against it.

Definition

Cost-benefit analysis (CBA) is a decision-making process where the expected benefits of an activity are weighed against the expected costs of engagement. There are a variety of choices and methods available when implementing CBA. This can lead to distinct differences in calculated conclusions. In the area of energy and the natural environment such as identifying the quality and amount of natural resources available or being utilized, this methodology continues to be used in a variety of ways (Hanley and Spash 1993). Energy companies often apply CBA to decide if a new energy project should be undertaken (energy exploration, building or modifying energy producing infrastructure, energy technology research and development, etc.). The analysis may be applied for internal use by the company or in response to external regulation. Stakeholders external to the firm (environmental watch groups, regulators, consumers, etc.) often use CBA to evaluate ongoing or proposed operations or to assess activities of energy companies for their current or potential impact on society and the natural environment. Governments also design and implement policies by using CBA to ascertain the effects of promoting certain energy-related activities (e.g., production of clean energy or energy conservation) or discouraging certain environmentally harmful energy-related activities, such as pollution or overuse of natural resources (Hutton and Rehfuess 2006). While not without criticism, CBA remains a useful tool for evaluation in the area of energy and environment.

Introduction

There is no one set way to define how to conduct a cost-benefit analysis (CBA). However, it is useful to have a basic framework to understand how the CBA process can be used to advance energy and environmental concerns. To that end, decision-makers may apply a multistep CBA process, reflecting upon several areas of consideration prior to making a decision, such as one that poses a new form of energy and its impact on

people, the planet, and profits (i.e., the triple bottom line). The initial five steps are as follows: *define the activity, identify relevant stakeholders, identify cost and benefit sources, assign monetary values, and apply a decision-making criterion*. Assessing the uncertainty of a CBA analysis is sometimes valued as well, viewed as the sixth step.

Defining the activity refers to defining what activities that the cost-benefit analysis is being applied to and, perhaps just importantly, the activities being excluded from the analysis. For example, if considering a possible investment in a new nuclear plant, is one location being considered or multiple locations? If trying to assess the environmental effects of a new exploration for shale gas, are the immediate effects of the investment being assessed, or is the analysis also including the projected lifetime effects of the gas acquired? In other words, this initial step in the CBA process involves defining the scope of the activity being considered. This is important for deciding which costs and benefits need to be defined and ultimately included. Importantly, this step also determines the time horizon to be considered.

Identifying relevant stakeholders refers to figuring out for whom the costs and benefits are being incurred or accrued by, respectively. It also suggests a need to decide under what metric the impacts to stakeholders will be judged. For example, if a company is considering building a new refinery, are they only considering effects on internal stakeholders such as shareholders, or are they also giving consideration to external stakeholders such as those living in the vicinity of the refinery? This step is complementary to the first step, in that together they define the parameters of the overall goal(s) of the CBA (maximize lifetime organizational profit, maximize social welfare of those in a 5-mile radius, etc.). Of course, legal requirements may impact this step by requiring certain stakeholders to be considered as well as other types of external demands, such as pressures emanating from civic community groups or environmental watch groups. Even so, an organization may well make decisions that are consistent with its own philosophical vision,

mission, and values. Other additional ethical concerns may also be considered, stemming from external stakeholders beyond any regulatory compliance issues. As mentioned, when stakeholders, however defined, are considered, a decision about what metric to apply must be addressed. For example, how will the firm measure the well-being of those stakeholders? Are only monetary effects being considered, or are health impacts also part of the metric to determine well-being? Other concepts, like utility maximization or Pareto optimality, may or may not be incorporated. Forming a rationale for the decision to include these elements is a core component of this step.

Identifying cost and benefit sources involves cataloguing exactly what activities (or projecting what activities) are going to occur, when they will occur, and in what amounts. This is a necessary step prior to assigning monetary values. For example, suppose a company is considering the expansion of an existing oil refinery, in order to add capacity. This means decision-makers will likely need to incorporate a host of resources and account for them in CBA assessment effort. This might include construction needs, such as raw materials and labor hours. Additionally, elements like the amount of lost capacity should an existing facility have to be shut down for periods during construction should be considered as well. Depending on choices made in earlier steps, decision-makers may need to determine the cost of noise pollution, due to the construction. Such information requires projections about future yearly maintenance costs, as well as future yearly pollution levels. Of course, projections about the future amounts of added capacity and usage need to be included. Again, there may be many other potential sources and amounts of cost and benefit occurring at various points in time in the future. Therefore, this step involves substantial amounts of estimation, projection, and forecasting. It is expected that the farther out the time horizon extends, the uncertainties embedded within provisional estimates will increase.

Assigning monetary values refers to the need to assign a common unit of account for measuring

value to each of the identified costs and benefits from the previous step. Sometimes this is straightforward if the cost or benefit is realized in the current time period and a relevant market exists. In such cases, the market price can be used to figure out the monetary value of the cost or benefit. If there is a relevant market, but the cost or benefit will be realized in the future, then an estimate or projection of the future market price is needed. This requires an informed educated guess, likely prepared via use of a statistical or theoretical methodology to create a justifiable estimate. There are likely items that require inclusion, for which no market exists and so no price estimate or clear way to measure the variable's value is available. In such circumstances, a more sophisticated statistical and financial analysis may be needed in order to assign monetary values. For example, the labor hours to add capacity to a refinery this year are likely known (as labor markets with comparable wages exist). Additionally, future values of gasoline refined from oil may not be known. Because markets exist, projections about the market prices can be formed. However, there may be no market for the pollution levels the new refinery capacity adds to the environment, so forming a quality estimate of the value of this variable calls for more effort. As a result of the incorporation of multiple estimates, this step often adds substantial uncertainty to the CBA analysis, on top of the uncertainty from the previous step.

For non-monetary valuation such as pollution levels, there are two main methodologies: *revealed preference* and *stated preference*. With *revealed preference* methods, values are inferred from previously completed market actions. The concept is that embedded within these actions is information about the value of non-market activity, which can then be extracted. For example, in generating electrical power, a production function might be estimated, and the value of the spillover effects like pollution emissions can be teased out. With *stated preference* methods, surveys are conducted to estimate the impact values on affected stakeholders. For example, if a stakeholder lives near a refinery, what would the

party be willing to pay to move out of the range of the pollution emanated by the refinery? This information can reveal some information about their perception of the negative value of the pollution's impact.

Applying a decision-making criterion involves selecting a way to weigh the monetary values of costs and benefits against each other and ultimately decide whether the activity should proceed or not. There are many ways to do this in practice, but arguably the two most commonly used are *net present value* and *internal rate of return*. One issue that is common to both methods is that they recognize the time value of money. That is, dollars, whether gained as benefit or lost as expense, have different values depending on when they occur. Generally dollars received or spent closer to the present have a greater value than those received or spent in the future. This is due to issues such as risk, inflation, interest, and even stakeholder preferences. Much like CBA itself, these criteria are not without criticism. Particularly, there is a level of subjectivity in deciding how to weigh the costs relative to benefits over time (e.g., choosing a discount rate).

In *net present value* methodology, the estimated monetary values of the costs are subtracted off from the benefits to create a net benefits number for each point in time. Then a discount rate is estimated (or assumed) in order to account for the time value of money. The discount rate effectively weights or places a level of importance (or lack thereof) on the different net benefits based on when they occur in time. Those weighted net benefits are then added up to become one number called the net present value. Any activity that has a positive net present value is viewed favorably.

In *internal rate of return* methodology, the decision-maker selects a required rate of return, that is, a minimum rate of return that the activity must generate to be considered worthwhile. The required rate of return may be selected based on alternative uses, of the resources involved, and/or other estimation methods, including those applied on an ad hoc basis. Then, similar to the net present value calculation, the stream of net benefits is

calculated. However, rather than estimate or assume a discount rate, the calculation is done to solve for a discount rate consistent with zero net present value. That discount rate associated with zero is called the internal rate of return for the activity. If the internal rate of return is greater than the required return, then the activity is viewed favorably.

Finally, it is commonplace to conduct some type of additional analysis in order to account for (or assess) the uncertainty in the CBA estimate itself. Often this takes the form of a Monte Carlo simulation, scenario analysis, or other types of sensitivity analysis. It is important to recognize that the fundamental forward-looking nature of CBA suggests that there will always be some uncertainty to the analysis regardless of how careful and thorough the analysis is conducted.

CBA and Government Policy

In the United States, cost-benefit analysis has a long history dating back to the early 1800s where it was recommended by then Secretary of the Treasury Albert Gallatin for evaluating water projects (Clinch 2004). Today, CBA is required by the Environmental Protection Agency (EPA) for economically significant rules (i.e., rules with an economic impact over \$100 million) (National Center for Environmental Economics 2010). Similarly, in Europe, CBA has been a regulatory requirement since 2000 (European Union Regional Policy 2008). This application, in the context of satisfying regulation or being applied by regulatory authorities in policy design and enforcement, is how CBA is most widely known and undertaken in the energy and environmental areas.

A major area of ongoing concern is the potential for market failure. That is, as a result of actions taken by a private company, there are often negative spillover effects on third parties. A private energy producing organization has a legal obligation to maximize value for shareholders. They do not, however, always give equal or

sufficient consideration to stakeholders (i.e., the broader group impacted by organization's actions spillover effects) that may be impacted by the actions of the firm (e.g., energy exploration and extraction). As such, government policymakers may enact regulation to require private energy companies to undertake CBA that incorporates the impacts on stakeholders or the broader society in general. This amounts to requiring companies to consider the net social benefits, which incorporates potential spillover effects into their internal CBA analysis. Alternatively, or in addition to such regulation, policymakers may use CBA to consider specific policies (e.g., taxes or subsidies) to align incentives, supporting the energy company's needs with that of society and the natural environment.

For example, the European Commission recently implemented an energy (electricity and natural gas) infrastructure package with a multi-billion Euro budget (Meeus et al. 2013). This includes developing an efficient network for the transmission and storage of electricity and natural gas across Europe. That package represents, in part, spending to bring energy company incentives in line with public (i.e., social) needs. As part of that package, there are regulatory requirements to conduct CBA in order to identify what are called projects of common interest (PCI).

One of the overriding issues when applying CBA in the context of governmental policy is the criterion used to evaluate projects. The convention, based on economic theory, is to apply *Pareto optimality*. This is the concept that at least one person is made better off while no one is made worse off. To illustrate, the EPA in practice refers to the *potential Pareto criterion*. This criterion requires that the net benefits to society be a positive sum, reflecting the welfare effects of the activities on all affected groups. Thus, in practice, this criterion is applied using what is called the *Kaldor-Hicks test*. This test reflects that those who gain from a policy should potentially compensate those who are harmed by it, so that no individual is made worse off. An activity with positive net social benefits would pass this test.

CBA and Innovation

One overriding fact of CBA is that the intricacy of issues involved with the activities in the energy sector and its multifaceted interactions with the environment add to the complexity of conducting a CBA, creating doubt around its usefulness. This is partly due to the uncertainty that is inherent as new technology and new techniques are employed. To illustrate, one of the more recent phenomena in the energy sector has been the proliferation of unconventional oil and natural gas extraction through horizontal drilling and hydraulic fracturing. The estimates of the expected costs and benefits, especially from a societal point of view, are not easily obtained and may reflect gross inaccuracies (Jackson et al. 2014).

In terms of benefits, there is little experience with this type of extraction method, so estimating production amounts, as well as how that production will change over time, is highly uncertain. Moreover, estimating direct revenues generated from one particular well has a high level of uncertainty. Recent volatility in energy costs suggests that even when there are market prices established, it is rarely easy to forecast value. Further, to the extent unconventional sources allow energy substitution away from larger polluting sources such as a coal, there are likely to be spillover benefits. Estimating this added benefit is uncertain. But the potential to reduce climate change risks could be huge.

On the cost side, a major concern is that this type of extraction requires substantial amounts of water usage. The opportunity cost of the water, as well as the ability to substitute potable for non-potable resources, along with other recycled sources, adds yet more uncertainty about whether these costs are severe or limited. The ability to estimate the potential for water contamination is also a serious issue. Hydraulic fracturing, for example, creates fissures that could allow underground avenues for contaminants to enter a drinking supply. Drilling and the application of new technologies also carry a potential for

various threats like the implications of break-downs, creating air pollution emissions, and causing other unknown harms to the natural environment and sentient beings. Finally the potential risk of seismic activity is unclear.

As the demand for energy continues to increase around the world, this necessitates improvements toward conservation by both consumers and producers. But this also means working to produce more forms of renewable energy with greater efficiencies. Use of a CBA process is likely to be a central component of moving to achieve such efforts. As the complex issues of nonconventional energy extraction methods like hydraulic fracturing illustrate, new technologies will always require greater scrutiny to assess the potential effects on the net benefits accrued. Careful attention must be paid to how stakeholders are defined. When narrowly viewed, as the firm's shareholders, the broader impacts to stakeholders (people and the planet itself) may be overlooked. Given short-termism tends to be the focus of market-driven shareholder-based organizations (Sekerka and Stimel 2011), greater scrutiny toward increasing the consideration of costs and benefits over time remains a crucial aspect of conducting CBA in an ethical manner.

Summary

Despite the fact that there are inherent challenges and the details of any CBA are subject to valid criticism and review, it remains a useful tool. Cost-benefit analysis lends itself to transparency as it requires documentation of the steps undertaken and revealing the assumptions being made. CBA requires organization and thoroughness to be conducted effectively. It forms a logical and consistent process that can be understood by all. It also is a system of decision-making that is robust enough to be amenable to improvements while still maintaining its requisite properties. Given its practical usefulness and its role as a regulatory function, CBA will likely continue as a central element that

frames and guides decision-making in the energy sector. Let us hope that stakeholder issues and longer-term considerations for health and well-being of society and the natural environment will play a more dominant role in determining the merits of each step.

Counterproductive Work Behaviors

Ewa Beck-Krala

Faculty of Management, AGH University of Science and Technology, Krakow, Poland

Synonyms

Deviant workplace behavior; Employee misconduct; Unethical behaviors; Workplace incivility

Definitions

Counterproductive work behaviors (CWB) are actions and behaviors employees engage in that detract from legitimate organizational goals or well-being and that bring about undesirable consequences for the organization or its stakeholders (Ones and Dilchert 2013, p. 645). Thus, CWB are any actions that violate legitimate organizational or stakeholder interests.

Introduction

Increased awareness of the ethical impact of counterproductive work behaviors in business has been reflected in the research. Counterproductive work behaviors are a serious problem for organizations, economies, and even society as a whole. Unethical employee behaviors can have tremendous negative consequences in such sectors, where employee decisions and behaviors may have detrimental impacts that extend far beyond the confines of the organization. They may impact the greater population, affecting all aspects of life.

Counterproductive work behaviors (CWB) refer to any actions taken by employees that are intended to harm the organization (Neuman and Baron 1998; Spector et al. 2006) or organizational stakeholders, mostly other employees. CWB usually have a detrimental impact on organizational performance (Marcus and Schuler 2004). Counterproductive work behaviors encompass a

spectrum of actions that harm employees or organizations and may include bullying, emotional abuse, revenge, retaliation, mobbing, and aggression. Depending on their frequency, form, and strength, these acts can range from severe, systematic, abusive bullying to milder, ambiguous episodes of workplace incivility (Spector et al. 2006). Kelloway and colleagues add that counterproductive work behaviors subsume behaviors such as theft, sabotage, workplace violence and aggression, incivility, revenge, and service sabotage (Kelloway et al. 2010).

Taxonomy of Counterproductive Work Behaviors

In the literature, as well as in practice, there are a number of terms used to denote negative behaviors that harm either organization or their employees as well as violate organizational and societal norms or standards. Due to nuances in terminology, not all terms are synonymous. The most common interchangeable terms used in this context include counterproductive, unreliable, deviant workplace behavior, organizational misbehavior, workplace incivility, or even organizational delinquency (Anderson and Pearson 1999). Many of these specific behaviors are often referred to as CWB in the literature and could be included in several or most of the terms and concepts.

Some researchers emphasize that unethical behavior is the most commonly used organizational term (Werbel and Balkin 2010), whereas others understand unethical employee behavior to be a part of counterproductive work behaviors (Ones and Wiernik 2018). Jacobs et al. (2014, p. 64) understand unethical behavior as referring to behavior that violates moral norms accepted by a larger community and that goes beyond local organizational norms (Kaptein 2008). The authors distinguished between counterproductive work behaviors and unethical behavior, arguing that CWB reflects violations of organizational norms, while unethical behaviors violate broader societal norms (Trevino et al. 2014). According to the researchers, CWB are scalable actions and

behaviors that employees engage in that detract from legitimate organizational goals or well-being and include behaviors that bring about undesirable consequences for the organizations or its stakeholders (Sackett and DeVore 2002; Ones and Wiernik 2018). Thus, CWB are any actions that violate legitimate organizational interests or stakeholders.

Despite many nuances in terminology and understanding of CWB, Ones and Wiernik (2018) proposed a consensus taxonomy of CWB. According to the authors, all CWB may be divided into behaviors that are harmful to individuals, organizations, and society at large (Ones and Wiernik 2018, p. 40) (Table 1).

CWB can be unethical if they are performed to exploit others for some other end. Thus, unethical behaviors may include lying, misrepresentation, cheating, bribery, operating with a conflict of interests, abusing one's position for personal ends, and breaking laws and regulations (Ones and Wiernik 2018, p. 37). Unethical behaviors are also more often associated with professional and senior and middle management than with lower levels of employees; however, this is not a sufficient and correct distinction between CWB and unethical employee behavior (Ones and Wiernik 2018). An important trait of CWB is a focus on behavior, not intent, as CWB do not need to be performed intentionally (Ones and Wiernik 2018; Spector and Fox 2005). This means that employees may engage in and perform

CWB accidentally or unknowingly. Moreover, CWB may be a result of both individual as well as collective actions. Most studies concerning CWB have focused on the causes of such behaviors which could help explain the phenomena and prevent CWB within the organization.

There are also other terms in the literature that are used in the context of unethical behaviors and CWB. Thus, employee deviance is defined as behavior that includes violating formal and informal organizational policies, rules, procedures, or specific job-related performance standards (Robinson and Bennett 1995). Then, organizational deviancy encompasses a wide array of counterproductive acts, such as theft, drug and alcohol abuse, lying, insubordination, vandalism, sabotage, absenteeism, and so called assaultive actions (Neuman and Baron 2005). Similarly there is organizational misbehavior which describes behaviors that involve any intentional behavior of employees that "violates core organizational and/or societal norms" (Vardi and Wiener 1996, p. 151). In this case, intentionality is a crucial aspect of different types of organizational misbehavior. According to the authors, misbehavior may be intended to benefit the self (i.e., instrumental actions designed to benefit the "actor" of the negative behavior), behavior that is intended to benefit the organization (e.g., misrepresenting corporate earnings to inflate stock prices), or misbehavior that is intended to inflict damage. In turn, workplace incivility concerns rude and disrespectful actions which demonstrate disregard for others in the workplace and violation of workplace norms for respect (Anderson and Pearson 1999, p. 455). In this case, the characteristic of incivility is that the "intent to harm is ambiguous" (Anderson and Pearson 1999, p. 456), whereas other forms of workplace aggression and mistreatment at work have the obvious intent to harm or injure someone physically or psychologically. Finally, organizational delinquency is understood as a wide syndrome that consists of elements of counterproductive acts, such as vandalism, sabotage, theft, lying, alcohol and drug abuse, and assaultive actions (Ones and Wiernik 2018).

Counterproductive Work Behaviors, Table 1 Simplified taxonomy of CWB. (Source: Based on Wiernik and Ones 2018, p. 41)

Counterproductive work behaviors	
Interpersonal CWB	Organizational CWB
Abuse/bullying (inappropriate verbal actions, aggression, interpersonal incivility)	Theft, misuse of organizational resources
Violence	Intellectual property violations
Discrimination	Unsafe behavior/disregard for others
Sexual harassment (inappropriate physical actions)	Alcohol and drug use
	Withdrawal
	Production deviance (poor quality of work)
	Sabotage

As it is difficult to determine the exact limits of individual constructs, they can generally be called negative behaviors in work settings. These negative behaviors break widely unregulated moral or organizational norms and may be classified as unethical behaviors. In the era of social responsibility, these have particular negative overtones.

The Most Common Causes of Counterproductive Work Behaviors

Among the most common antecedents of counterproductive work behaviors, researchers have identified both situational and individual factors.

- Research that focuses on situational factors explores how situational constructs are related to CWB (Skarlicki and Folger 1997). For example, interpersonal conflicts and job dissatisfaction are positively correlated with both interpersonal and organizational CWB. Moreover, CWB is usually a result of employee frustration, which may rise from situational constraints (Spector and Fox 2005). Furthermore, research has shown that employees who experience family responsibilities interfering with their work perform more CWB (and display lower citizenship behaviors) than do those who do not experience family – work interference (Mercado and Dilchert 2017).
- Another research stream focuses on individual factors and explains how individual differences in particular traits can be possible antecedents of CWB. According to the research, some personal traits (such as anger, attribution style, and attitudes toward revenge) have all been found to correlate positively with CWB, similar to negative affectivity, narcissism, and low self-control (Martinko et al. 2002).
- Finally, integrative approach underlines the importance of examining both the individual and situational factors along with their interactions in predicting CWB (e.g., Robinson and Bennett 1995; Martinko et al. 2002).

Spector and Fox identified the two most important causes of CWB: organizational factors, such as injustice, stressors, and personal factors, such as negative affectivity and hostile attribution bias. These factors, as well as their interactions, contribute to CWB (Spector and Fox 2005). Some studies have analyzed the physical, social, and organizational context of CWB. In general, negative and stressful experiences in the workplace, such as abusive supervision, problematic leadership, or incivility, lead to CWB. Sometimes even a single organizational event can have a strong impact on subsequent CWB (Kelloway et al. 2010).

According to the research, most cases of CWB result from unhappiness with the organizational situation. Organizational policies, procedures, and practices may unintentionally influence CWB. Moreover, HR practices associated mostly with performance appraisal and compensation may lead to employee misconduct (Werbel and Balkin 2010, p. 318). Werbel and Balkin suggested that certain rewards systems, such as sales commission plans and large cash bonuses, may encourage employees to engage in misconduct. According to authors, the greater the proportion of performance contingent upon individual incentive compensation in relation to base pay, the greater the likelihood of misconduct (Werbel and Balkin 2010, p. 320). Organizations that use outcome-based performance evaluations are likely to have employees who perceive higher benefits of misconduct and lower perceived costs of misconduct, compared to organizations that use behavior-based performance evaluations.

Consequences of CWB

As with other types of harmful behaviors, CWB have drawn considerable attention because of huge financial, personal, and organizational costs associated with counterproductive behaviors (Kelloway et al. 2010) and the many resulting negative consequences for both organizations and its main stakeholders – mostly employees.

Consequences of CWB on an organizational level:

- Financial losses – theft causes huge financial losses for most organizations (Kelloway et al. 2010); additional losses are incurred from damage caused by sabotage and lower productivity (taking long breaks, wasting resources), which are difficult to quantify in currency terms, and fines (penalties) that organizations must pay as a result of CWB are costs borne by the organization.
- Reputational losses – CWB are often widely discussed among employees. Depending on the scale and consequences of public revelations, the organization may suffer loss of customers, investors, and employee trust and even a decrease in brand credibility.
- Socio-psychological losses, including health costs – counterproductive work behaviors can be extremely costly to organizations in terms of labor turnover, distracting staff from regular work, and in costs associated with formal investigations and court cases. These can cost staff considerable anxiety and stress and ultimately affect their health. CWB lead to an unsafe and insecure environment with adverse effects on the performance and safety of employees. Finally, an uncomfortable and toxic organizational climate and stress result in lower engagement, causing further deterioration of the physical and mental well-being of employees or even loss of employees.

On the other side, there are also negative consequences of CWB on the individual level that can be even more costly, as they can significantly interfere in employee lives. Consequences of CWB on an individual level include (Turek 2012):

- Negative mood (anxiety, anger)
- Cognitive impairment (concentration problems)
- Psychological effects (low self-esteem, emotional problems, and even depression)
- Somatic impairment – health problems
- Organizational dysfunction (absenteeism, withdrawal, low productivity and commitment, conflicts, leaving work)

Regardless of the scale of the phenomenon and its essence, CWB have severe negative effects both on individuals, reducing their quality of life, and on the organization itself. Therefore, it is necessary not only to react quickly to such behaviors but to counteract them effectively.

Possible Preventative Actions Toward CWB

Research on CWB has increased in recent years because of the staggering costs that CWB are causing. Most of this research has focused on understanding why individuals engage in these behaviors and how these behaviors might be prevented. Most studies confirm that such measures should take a two-prong approach: first, focus on organizational activities related to relevant personnel and, second, focus on the unit and promotion and training of appropriate work attitudes and behaviors.

For trainings, it is important to increase employee sensitivity and awareness regarding CSR and CWB and support employees in their daily work through open communication and appropriate working conditions and a safe working environment. Others suggest the importance of hiring employees with personality traits that do not lean toward CSW and CWB in the first place. This is connected with managing the risk of hiring employees with tendencies to CWB. Employers may look for more conscientious and self-controlled employees who would be less likely to engage in CWB. Selection methods such as integrity tests, personnel screening, and pre-employment testing can be used to identify applicants who are less prone to CWB.

The second aspect of preventing CWB is the focus on the organizational context. Perceptions of fairness mediate the relationships derived from standard agency theory through positive and negative reciprocal behaviors. Therefore, boards and managers may focus on improving social welfare by initiating positive reciprocity and avoiding unnecessary, welfare-reducing

“revenge” behaviors, rather than aiming to limit CEO self-serving behaviors. A positive, organizational climate based on fair treatment may be one of the most important aspects of preventing CWB. Employees should be treated with trust, respect, and dignity. Thus, designing HR procedures and tools that are acceptable to employees and viewed as fair seems crucial. Procedures and tools connected with employee performance, rewards, and appraisal are sensitive and can cause bad employee experiences and create a sense of injustice. Furthermore, support for employees, employee assistance programs, and training in conflict management skills are also helpful. The more performance appraisal assessments are gathered from multiple and diverse sources (such as 360 degree feedback), the less will be the possibility of employee misconduct. In this context it is also important to take steps to reduce job stress in the organization.

Summary

Corporate social responsibility poses many challenges for organizations. Some of them relate to the disclosure of CWB, as well as effective prevention of such behaviors. Counterproductive work behaviors are actions that harm and violate organizational interests or stakeholders. CWB may be directed toward both individuals and organizations; therefore, they may result in many detrimental effects on these stakeholders and on the organization itself. Today, many cases of CWB have become public. These disclosures provide opportunities for effectively combating and even preventing such behaviors. Similarly, as with the taxonomy of CWB, possible ways of preventing CWB may focus on both individuals and on organizations. Corporate social responsibility within organizations may put special emphasis on creating a culture that promotes socially responsible employee behaviors and trains employees in this regard. Additionally, creating a workplace based on high ethical and moral values, such as respect, transparency, dialogue, and justice, and the construction of a

supportive work environment can effectively counteract CWB.

Covestro AG

Knut Kipper
Witten/Herdecke University (UW/H), Witten,
Germany

Introduction

Covestro AG is headquartered in Leverkusen, Germany, with global operations, producing a vast range of raw materials based on polyurethane and polycarbonate for industries such as automotive, electrical engineering and electronics, construction and home products, and sports and leisure. Covestro, formerly one of the key pillars of BAYER AG then known as Bayer MaterialScience, was spun off in the fall of 2015.

The name Covestro is made from a combination of words that reflect the identity of the new company. The letters C and O come from collaboration, while VEST signifies the company is well invested in state-of-the-art manufacturing facilities. The final letters, STRO, show the company is strong. It is strong in innovation, strong in the market and with a strong workforce. (Thomas 2015)

Covestro provides unique products including isocyanates and polyols for cellular foams, thermoplastic polyurethane and polycarbonate pellets, as well as polyurethane-based additives used in the formulation of coatings and adhesives. These are materials the world depends on every day. For example, their high-tech polymers are used in nearly every area of modern life and in a wide range of sectors such as automotive, construction, health care, cosmetics, energy, electronics, and sports and leisure.

From a CSR and sustainability perspective, Covestro is interesting because of several aspects. During its early days, the company worked with John Elkington, author of *Cannibals with Forks: The Triple Bottom Line of twenty-first Century Business* and many more books focusing on the topics. During that time, Covestro was communicating about their triple bottom lines and then shifted the focus on sustainable development goals and finally adopting an intense focus on the circular economy in more recent years. This concept is interesting, because in order to make an undertaking such as Covestro totally circular/independent of nonrenewable resources, it would take exponential amounts of renewable electricity/energy that is currently unavailable. This is also why Covestro's leadership often and openly criticizes the slow expansion of wind and solar power, although critics argue they are merely externalizing their own responsibility to find a viable solution towards a circular economy.

The History

In 2015, when Bayer MaterialScience became Coverstro, top leadership often broadcasted a new mantra of being curious, courageous, and colorful. The company's first CEO, Patrick Thomas, often described the newly launched spinoff as something along the lines of a start-up with 80 years of history, 16,000 employees and €12 billion of revenues.

In the case of Covestro, the old proverb "history is preface" is highly relevant. Early in 2004, a major restructuring process was in full effect at Bayer in the divisions: Bayer Chemical, Bayer

Material Science, Bayer Pharma, and Bayer CropScience. Bayer Chemicals, and approximately a third of the BMS business and its production facilities, were transferred to the newly founded company, Lanxess. In November 2004, during an extraordinary shareholder meeting of Bayer AG, more than 99% of the shareholders voted in favor of a complete spin-off of Lanxess from Bayer. No real initial public offer happened; Bayer simply had the shares of this spin-off booked to their existing portfolios. Back then, stake- and shareholders had the perception that Bayer did not devote enough resources to set the new company up for success, and even though Lanxess managed to turn the business around many employees at the time paid a price for the restructuring.

Ten years later in September 2014, Bayer announced the spin-off and the IPO of the remainder of BMS. The renaming of BMS to Covestro took place on September 1, 2015. In comparison to Lanxess or Currenta, two divisions that were also once part of Bayer until their divestitures, Covestro experienced a privileged and well-nurtured separation from Bayer. Insiders who were active at Lanxess at the time had depicted a grim picture of what the company and its employees had to go through when they were spun off in 2004. Lanxess was in critical condition at the time, and it took a great deal of effort to keep the company stable, let alone transform it into one of Germany's leading specialty chemicals companies.

When Bayer was separating from BMS, market conditions were very different. Bayer was ready to realign its own portfolio, and the global economy was generally doing very well. A lot of resources were put into creating a narrative for this new company, its own brand identity and corporate culture. From marketing, public, and employer points of view, these measures were a total success. Its initial public offer of 24 Euros a share happened in September of 2015. By the end of January 2018, the stock price hit a record of around 95 Euros. Stock was sharply increasing, the initial anxieties felt by employees started to alleviate, and revenue and profits grew exponentially, quickly leading to respectable bonus

payments during the first years. In summary, at first glance the spin-off seemed to be a total success. The corporate culture, formed through the new mantra of being curious, courageous, and colorful, earning statements describing it as a start-up with 80 years of history offered a narrative of an extremely successful spin off. Almost everybody was happy.

After the spin-off, Covestro experienced an ideal market environment. In fact, it had a disproportionate market advantage at the time because of its toluene diisocyanate (TDI) production facilities, which were almost the only ones in the world that were operational. As of 2017, TDI became the main driver for Covestro's success. TDI is an organic compound that is extremely difficult to produce and is used in many processes such as manufacturing of mattresses, insulating materials, or coatings. Global demand for TDI has been insatiable for years, with demands that could not be met by suppliers. Companies like BASF, for example, could not get their own TDI production facilities online. Fast forward 2 years later, the situation at Covestro is vastly different from 2017, and TDI prices have been in steep decline due to a global oversupply of the compound.

Since then, Covestro has announced a general restructuring program to improve the company's performance. Further acquisitions have been made to complement its current portfolio. Time will show if the business units and the company as a whole will be able to distill the necessary synergies in order to maintain a pool position among its fierce and growing global competition. In 2020/2021, a major realignment of the young company took place, which was completed on July 1, 2021. The former three segments: polyurethanes (PUR), polycarbonates (PCS), and coatings, adhesives, specialties (CAS) were reshaped to seven, more customer centric, entities.

positioning under Patrick Thomas and Richard Northcote to a highly pragmatic, externalist approach under Thomas Toepfer and Markus Steilemann (Richard Northcote was the Chief Sustainability Officer of Covestro, who provided essential impulses such as integrating the UN SDGs into Covestro's sustainability program. He unexpectedly passed away in June of 2018.)

From a technical perspective, Covestro's road towards sustainability could be described as from carbon nanotubes to Cardyon carbon capture. In 2009, it was announced that Bayer MaterialSciences would expand its production of nanotubes, tiny cylinders of atoms that can be used for a wide variety of applications due to their electrical or mechanical properties. Examples of applications can be found in space- and aircrafts to reduce the weight and stress within components, as catalysts and in drug delivery systems as well as in applications related to conductivity in electronics (2009). The latest advance is Covestro's move towards partly replacing petroleum in plastics and synthetics with carbon dioxide as a base for its processes. The greenhouse gas that is one of the major causes for the climate crisis can serve as a valuable material source in plastic production. This revolutionary use of carbon dioxide is the result of the Cardyon process: reuse of CO₂ for polyols production developed in cooperation with the RWTH Aachen. From a perspective of circularity, this process answers many problems on the road to carbon neutrality. It saves fossil fuels, such as crude oil, of which the plastic industry is on track to account for 20% of total global oil and gas consumption by 2050. It further reduces the amount of atmospheric carbon dioxide because the carbon from CO₂ is essentially being recycled.

Mission/Objectives/Focus Areas

Several Key Milestones

To further have a better understanding of Covestro's sustainability trajectory, one would have to describe the development from the Bayer years to today. From a highly visionary

When an employee of Covestro is asked what he or she strives for as a member of the Covestro community, the answer is usually to make the world a brighter place. When company representatives speak at open forums or on the company's website, the mission, objectives, and focus areas

are improving the world through sustainable business processes, and by doing so, adding value. More recently, Covestro has a strong focus on the concept of circularity.

Climate change, growing world population, increasing urbanisation, hunger: global trends like these are enormous challenges. Covestro wants to contribute to overcoming them - with its wide range of innovative products and solutions. Because the high-quality plastics and their components that our company develops and produces are the key to a sustainable future. (*Our Objectives and Mission as a Company* | Covestro [n.d.](#))

This is the company purpose: We want to make the world a brighter place. Further, Covestro clarifies its purpose as giving the basic direction for its demonstrated responsible action for humanity and for generations to come, as well as the preservation of the natural foundations of life, while creating value in the tradition of “People, Planet, Profit.” While in 2015 3P was the guiding mantra, during more recent years, more emphasis is placed on broadcasting their efforts to become a circular business.

Covestro states very clearly that:

[...], the great social and economic transformation project to make the world climate-neutral and protect its shrinking resources. We will be fully circular – this is our vision that concretizes our purpose. (Our Objectives and Mission as a Company | Covestro [n.d.](#))

From its vision, Covestro derives its mission:

Our Mission dictates how we will achieve the Covestro vision: We want to promote innovation and growth with profitable products and technologies that benefit society and reduce the impact on the environment. (*Our Objectives and Mission as a Company* | Covestro [n.d.](#))

All of this is in line with Covestro’s core values that have been an important pillar of its communication strategy since day one of the spin-off of Bayer, namely – curious, courageous, and colorful. The fact is that Covestro is a small player (vs. BASF) with only limited impact when it comes to its product portfolio, value chains, IP/innovation portfolio, etc. The same can be said about its resources in comparison to the old Material Science days. For Covestro to truly be able to start a real a movement in the field of

circular economy cooperation and joint ventures with governments and on a B2B level are essential.

Structure of Governance/Leadership

In 2017, Markus Steilemann, a young and energetic executive with a long history at Bayer, became Chief Commercial Officer of Covestro and then Chief Executive Officer in June of 2018. Born in Germany in 1970, Steilemann graduated with a master’s degree in chemistry and chemical economics and a PhD in chemistry from RWTH Aachen University. His career began in 1999 at Bayer, holding several management positions with a focus in the Polycarbonates Business Unit at Bayer MaterialScience, the precursor company of Covestro, starting in 2008. Between 2013 and 2015, he led the BMS unit in China before joining the Board.

Considering further pros and cons, one should remember the former CEO, Patrick Thomas, occupied various positions at other companies in the industry prior to joining BMS. Conversely, Steilemann spent his entire career in the Bayer environment, a culture that is driven by hierarchy, and an authoritarian “my way or the highway” style of leadership that allows little room for mistakes (which does not come as a surprise considering the production of medicine and volatile chemicals does not leave much room for error). This mentality has permeated the entire company, and, like most of Bayer’s spin-offs, the remains of this culture can be seen and must be considered when further transforming the business to be prepared for today’s challenges. During interviews with several Covestro employees, it became clear that after the first honeymoon phase, a booming economy/business cycle right after the spin-off, sliding into recession, the pandemic, and, for the last year, struggling with intense energy cost, few at Covestro would still hold on to “the culture of a start-up tale.” To be fair, maybe that is not the ideal culture to strive for anyway.

Where several years back, Bayer’s structure would ease the losses of one division during a downturn, Covestro does not have that luxury

anymore and at times struggles with its newly gained independence. When the economic downturn started in early 2020, the leadership maintained in a sort of static position. Important investment decisions, strategic questions, etc., used to be answered in the prior Bayer construct by the very top and hardly by the actual divisions. A carve-out/spin-off must be for a corporation like it is for a child to learn how to walk. It is a process that takes time, and only time will show how a company performs under different market conditions. Yet, for this publication, due to Covestro's advances in the field of circularity, it is a fascinating company to observe from a sustainability perspective.

Activities/Major Accomplishments/Contributions

Here we could look back to a seemingly endless story of activities, major accomplishments, and contributions. Instead, we look at the latest activities to maintain focus on the current state of industry participants such as Covestro and sustainability. Industry experts know that Scope 3 emissions up and down the supply chain are very hard to measure and reduce, yet make up the majority of any product carbon footprint when it comes to CO₂ emissions. That is why the announcement that Covestro and LANXESS cooperate to produce more sustainable raw materials with reduced CO₂ footprint in January of 2023 is interesting. The announcement stated that these two Bayer spin-offs agreed on cooperating when it comes to the production of key basic chemicals, that Covestro uses certified renewable electricity for the energy intense electrolysis process in North Rhine-Westphalia and that this cooperation is going to lead to CO₂ emissions reduction up to 120,000 tons annually.

Cradle to Cradle

Juan Diaz-Granados

Canberra Law School, University of Canberra,
Canberra, ACT, Australia

Synonyms

2CC2; C2C; Cradle 2 cradle; Cradle to cradle design; Cradle-to-cradle

Definition/Description

Unlike the “cradle to grave” linear material flow, the term “cradle to cradle” (C2C) is used to explain an alternative approach that “waste” produced by industrial manufacturing processes can

be used in a new manufacturing cycle without degrading or downcycling the materials used in the process but rather improving the whole cycle. As a result, there is no such thing as “waste” under “cradle to cradle” flow. It is a more efficient process from an economic, environmental, and social perspective. One of the critical steps suggested for the implementation of the C2C approach is creating an inventory of materials used to produce a product and categorizing these materials into (1) an “X list,” which includes the most known harmful substances that must be discontinued and replaced; (2) a “gray list,” which refers to substances that, although problematic, are not harmful enough to be included in the “X list”; and (3) a “P list” (“positive list”), which includes substances defined as healthy and safe for use.

Introduction

Traditional industrial manufacturing processes are not sustainable from economic, environmental, and social perspectives. These processes are based on systems where goods are produced with a one-way and linear manufacturing flow (“cradle to grave”). Although efficient from an economic perspective, this approach to process is harmful to both the environment and ultimately humans. Alternatively, the “cradle-to-cradle” approach represents a cyclical flow of production that achieves better results in economic, environmental, and social terms.

Cradle to Grave (C2G)

The traditional way to deal with waste produced by traditional manufacturing processes is to dispose of it – by putting it into a landfill or burning it – or more recently by recycling it (Braungart et al. 2007). This approach is referred to as a “cradle to grave” (C2G) material flow (McDonough and Braungart 2002). It is a one-way, linear process where it is assumed that “raw materials are extracted from the environment, transformed into products and eventually disposed of” (Braungart et al. 2007).

Some of these materials can be recycled, leading some authors to refer to the process as “downcycling” rather than “recycling” (Braungart et al. 2007). This approach is taken because the materials used are not designed to be recycled and results in a downgrade in material quality (Braungart et al. 2007). Once a product has been recycled, the quality of its materials decreases, “making them suitable for use only in lower value applications” (Braungart et al. 2007). The “recycling” process, therefore, has ultimately a C2G linear approach (Braungart et al. 2007).

This C2G, including the recycling process and its failure to effectively reclaim waste, creates pollution or negative externalities. It jeopardizes not only the environment but also the welfare of all living beings. By polluting natural resources such as air, water, and soil, the manufacturing process is endangering the ecosystem and, consequently, human life as a whole.

Cradle to Cradle (C2C)

One alternative process to the C2G is “cradle to cradle” (C2C). This concept, coined by William McDonough and Michael Braungart in their seminal book “*Cradle to Cradle: Remaking the Way We Make Things*” (McDonough and Braungart 2002), embodies the alternative view that “waste” produced by industrial manufacturing processes can be used instead in a new cycle of manufacturing without downgrading the materials used (Braungart et al. 2007; El-Haggar 2007; Kumar and Putnam 2008). This view, therefore, claims that the orthodox concept of “waste” does not exist (McDonough and Braungart 2002). Unlike the one-way, linear approach of the C2G model, the C2C flow is viewed as a cyclical “metabolism” (Braungart et al. 2007) that enables manufactured products to “form a supportive relationship with ecological systems and future economic growth” (Braungart et al. 2007). This ecosystem approach enables “materials to maintain their status as resources and accumulate intelligence over time (*upcycling*)” (Braungart et al. 2007). Accordingly, “waste” resulting from manufacturing processes can be reclaimed and

used to enhance the cycle. This view emulates the cycle of nature by which “waste equals food” (McDonough and Braungart 2002; McDonough et al. 2003) and explains why the C2C model has been compared with biomimetic approaches (de Pauw et al. 2014). The conceptual foundation of the C2C concept is summarized by McDonough and Braungart in the following passage:

If humans are truly going to prosper, we will have to learn to imitate nature’s highly effective cradle-to-cradle system of nutrient flow and metabolism, in which the very concept of waste does not exist. *To eliminate the concept of waste means to design things – products, packaging, and systems – from the very beginning on the understanding that waste does not exist.* It means that the valuable nutrients contained in the materials shape and determine the design: form follows evolution, not just function. (McDonough and Braungart 2002).

Main Consequences of Cradle to Cradle

The C2C model has two main consequences. First, it not only reduces the harmful effects of industrial processes on the environment and society in general but also produces a positive impact. This model promotes “eco-effectiveness” (McDonough and Braungart 2002), which “moves beyond zero emission approaches by focusing on the development of products and industrial systems that maintain or enhance the quality and productivity of materials through subsequent life cycles” (Braungart et al. 2007). The C2C model, therefore, shifts the paradigm from consume and disposal to consumer and repurpose (McDonough et al. 2003). Under this approach, industrial production is no longer perceived as a generator of a negative ecological footprint but, instead, as a producer of positive ecological impacts (Rossi et al. 2008; Toxopeus et al. 2015). According to Toxopeus, de Koeijer and Meij, “[t]he Cradle to Cradle philosophy focuses on an ideological transition from ‘less bad’ to ‘more good’” (Toxopeus et al. 2015).

Second, the C2C model offers a more efficient economic result. The cyclical nature of the model, by eliminating the concept of waste, “supports and regenerates ecological systems and enables long-term economic prosperity” (Braungart et al. 2007). The C2C flow, therefore, eliminates the existing tension between economic growth and environmental protection (McDonough et al. 2003).

In sum, C2C “enables the creation of wholly beneficial industrial systems driven by the synergistic pursuit of positive economic, environmental and social goals” (Braungart et al. 2007), or stated differently, “C2C designs industrial systems to be commercially productive, socially beneficial, and ecologically intelligent” (McDonough et al. 2003).

Implementation

In their seminal book, McDonough and Braungart propose five steps to implement eco-effectiveness and the C2C process (McDonough and Braungart 2002). First, it is necessary to eliminate from industrial production those substances that are broadly recognized as harmful. This is called a “design filter” because it is an initial step of the production chain that discards harmful substances right from the product design.

Second, the product designer must select the substances used in the production process based on his or her personal preferences and available information. Product information that is usually available to the public is scarce. Consequently, the decision to use one product or the other – or one substance or another – in the manufacturing process must be made with the best information available, even if incomplete. In making this decision, designers should (1) ensure that the product or substance “does not contain or support substances and practices that are blatantly harmful to human and environmental health” (McDonough and Braungart 2002); (2) respect the people associated with the product, namely, producers, communities, carriers, and end consumers; and (3) prefer those products and substances that add creativity, delight, celebration, and fun.

Third, it is required to create a “detailed inventory of the entire palette of materials used in a

given product, and the substances it may give off in the course of its manufacture and use” (McDonough and Braungart 2002). For this, McDonough and Braungart propose to create three different lists: (1) an “X list,” which includes the most known harmful substances that must be discontinued and replaced; (2) a “gray list,” which “contains problematic substances that are not quite so urgently in need of phaseout” (McDonough and Braungart 2002); and (3) a “P list” (“positive list”), which includes substances defined as healthy and safe for use.

The fourth step is to activate the “positive list” and, based on it, design the product from beginning to end as a cyclical metabolism. Finally, the fifth step is reinventing the product. The new possibilities of economic, environmental, and social benefits derived from C2C allow a redefinition of the final product. Thus, the design of, for instance, a “car” can be redefined as the design of a “nutrvehicle.” This redesign and redefinition of the final product changes it from making cars with zero negative emissions to making cars that are “designed to release positive emissions and generate other nutritious effects on the environment” (McDonough and Braungart 2002).

Summary

To sum up, C2C is an alternative view that denies the traditional concept of “waste”. It argues that “waste” produced by industrial manufacturing processes can be reclaimed and used in a new manufacturing cyclical flow which is improved by the C2C process.

Definition

Creating Shared Value (CSV) is a concept that brings business and society together so that entrepreneurial activity is profitable and increases the well-being of citizens in the local community.

Business Ethics Is about Responsibility

Responsible business activities follow lines that are desirable in terms of the objectives and values of society (Bowen 1953). This raises the question of how companies engage in business for societal good. The aim of Corporate Social Responsibility (CSR) is “maximizing the creation of shared value for their owners/shareholders and for their other stakeholders and society at large as well as identifying, preventing and mitigating their possible adverse impacts” (European Union Commission 2019, 3).

According to the classical understanding of CSR, a social engagement is a cost to the entrepreneur. Creating Shared Value (CSV) constitutes a profitable version of the traditional CSR. According to CSV, entrepreneurs create economic value by fostering societal value. This is with regard to an aim of redefining the neoliberal purpose of the corporation. The idea is that the competitiveness of the company correlates with the

well-being of citizens in a society (Porter and Kramer 2011).

Concept of Creating Shared Value (CSV)

CSV is an extension of Stakeholder Theory (Freeman 1984). CSV applies an integrative approach to business ethics by doing business and finding solutions to societal challenges together (von Liel 2016). Also, Social Entrepreneurship (SE) integrates conscious moral behaviors into business activities (Bowen 1953). SE is a concept aiming at social benefits without targeting financial profitability. Benefits for society may be direct or indirect. Direct benefits can be services, gifts and care or buildings, scholarships and aid. Indirect benefits include employment. The entrepreneurial process may involve hiring a select group of people. (Tan et al. 2005.) There are similarities between SE and CSV. CSV is grounded in the circumstances where “companies have overlooked opportunities to meet fundamental societal needs” (Porter and Kramer 2011). However, in contrast to SE, CSV is aimed at fulfilling basic human needs in society alongside financial profitability (Beschoner 2013).

CSV is about enhancing the competitiveness of a company while simultaneously enhancing the social circumstances of the communities in which it operates (Porter and Kramer 2011). Enabling strong local ecosystems for business is a concrete way to create shared value. Strong ecosystems have a positive impact on productivity and innovation. They foster efficiency and ease of collaboration. Value can be created, for example, by relocating production back to its home markets. This is a special feature of CSV that cannot be found explicitly in related responsibility concepts (von Liel 2016).

Implementation of CSV is based on five principles. First, ethics are integrated into the business strategy. Then shared values are identified by combining societal problems and the purpose of the business activities. After that the business activities are ready to be started. Progress is tracked during the process and insights will be utilized to upgrade business activities (Fig. 1).

Fig. 1 Implementation of
CSV (Adapted from Porter
et al. 2012)

Future of CSV and Business Ethics

Integrative business ethics is a dynamic and critical reflection process of entrepreneurial activity in its context. In its widest sense, it is about integral profit maximization, social engagement, and environmental sustainability. In the midst of globalization, responsibility has focused more on decent work, multiculturalism, and transparency in recent years. This combination resonates with CSV because improving the living conditions of poor people is at the center of the concept (von Liel 2016). A major criticism of CVS is that it focuses mainly on economic and social challenges in society. In the other words, it does not offer a holistic point of view over business activities including adverse impacts such as waste, pollution, and CO₂ emissions. It could also be anchored deeper in organizational culture and the motivation of employees so that corporations seek socially acceptable goals in a socially acceptable manner (Crane et al. 2014).

Summary

Due to climate change, as well as a more and more evident ecological crisis, environmental issues will be in high demand in the near future. This raises a need for normative approaches such as Responsible Business Conduct (RBC), defined by the OECD as “making a positive contribution to economic, environmental and social progress with a view to achieving sustainable development, and avoiding and addressing adverse impacts related to an enterprise’s direct and indirect operations, products or services” (OECD 2011). In the future, business ethics concepts that integrate not only economic and social interests but also environmental targets in one objective function are needed. Therefore, the future of business ethics may lie in co-benefits. This means that business activities will co-benefit customers, employees, stakeholders/owners, society, and global development with regards to the intergenerational link.

Definition/Description

Credit unions are regulated financial cooperatives that are owned by their members, who are also their customers. They operate in relationship-based retail banking business (McKillop et al. 2020). A defining characteristic of credit unions is their membership requirement, known as a common bond (Emmons and Schmid 1998; Frame et al. 2002). The common bond specifies who is eligible to join a particular credit union. It is based on a social connection, which could arise through location of residence or place of work, occupation, membership of an association, or a combination of these (McKillop and Wilson 2015; Pavlovskaya et al. 2020).

Within their common bonds credit unions operate inclusively, by offering their services to members of all income levels and backgrounds. The early credit cooperatives, that preceded credit unions, were established in the 1800s to provide credit to artisans, traders, and farmers who were financially vulnerable and experiencing exclusion (Guinnane 2001, 2011). Modern credit unions remain nondiscriminatory and are committed to social responsibility, which is one of the operating principles of the international credit union movement (WOCCU 2017; Decker 2010; Stoffman 2017).

Credit unions' main purpose is not to make economic profits for distribution to shareholders or managers (Jenster and Overstreet 1990; Worthington 1998; Frame et al. 2002). Rather, they have a dual purpose to balance social and economic goals (Taylor 1971). Surpluses are distributed to members as dividends, used to improve the cost and quality of services, or retained to strengthen the institutions' capital base.

Introduction

The potential for credit unions and other financial cooperatives to promote sustainable development and sustainable finance continues to attract attention. Researchers and international bodies have commended financial cooperatives for operating sustainable business models that allowed them to be more stable and efficient than investor-owned banks during the global financial crisis (Groeneveld and de Vries 2009; Birchall and Ketilson 2009; Crear 2009; International Labour Office 2012; Birchall 2013; Becchetti et al. 2016). Another reason for interest in credit unions is their inclusive banking approach that improves access to financial services (Jones 2008a; NEF 2014; Muriuki 2019). Access to finance in appropriate forms is associated with several of the Sustainable Development Goals, including poverty reduction (SDG 1), food security (SDG2), good health (SDG 3), economic growth (SDG 8), social cohesion (SDG 11), and minimizing inequality (SDG 5, SDG 10) (Klapper et al. 2016; Kara et al. 2021).

The term financial cooperatives covers cooperative banks, savings, and credit cooperatives, *caisse populaires*, shinkin banks, banks that are owned by consumer or agricultural cooperatives, and credit unions (ILO 2012; McKillop et al. 2020). Croteau (1963) described credit unions as pure cooperatives, because they deal exclusively with their members. The World Council of Credit Unions (WOCCU), which is the global trade association and development agency for credit unions and savings and credit cooperatives, defines a credit union as a customer/member owned financial cooperative, democratically controlled by its members, and operated for the purpose of maximizing the economic benefit of its members by providing financial services at competitive and fair rates (WOCCU n.d.). This definition does not make explicit reference to credit unions' social goals, but social responsibility is one of the operating principles set out by WOCCU for credit unions. This entry explores the origins of credit unions, the status of the credit union movement, the principles that influence credit unions' operations and governance, and some key sustainability issues facing the movement.

Origins of Credit Unions

Modern credit unions are variants of cooperative institutions that originated in mid-nineteenth century in Germany to address the financial inequality experienced in some communities as the Industrial Revolution unfolded. Friedrich Raiffeisen, a Lutheran layman and mayor, established rural credit cooperatives for small farmers and rural laborers while Hermann Schulze-Delitzsch, who was a lawyer, judge, and politician, established urban credit cooperatives for artisans and shopkeepers (Guinnane 2011; Fonteyne and Hardy 2011). Although these two cooperative models were based in very different communities, they had common goals of responding to market failures that were caused by information problems. These failures limited access to finance for some people and resulted in a worsening of poverty. Guinnane (2001) explains that it was the "unusual circumstances" of some

people that made it too risky, too costly, or impossible for mainstream banking institutions to make decisions on their creditworthiness and serve them.

Early credit cooperatives addressed the information problems and lack of collateral that affected their members' ability to borrow elsewhere by using the preexisting social connections between them to form a common bond (McKillop and Wilson 2011). The common bond is a membership requirement that specifies who is eligible to join a particular credit union. Emmons and Schmid (1998) describe the common bond as the organizing principle of a credit union. Depending on the type of common bond, membership could be organized by residence, place of work, occupation, membership of an association, or a combination of these.

Organizing credit cooperatives' membership around preexisting social connections allowed these institutions to reduce information gathering and credit processing costs. They became better placed to discipline the behavior of members and reduce losses from bad debts (Black and Dugger 1981). The common bond created a source of competitive advantage for the credit cooperatives as it enabled them to become specialists in member intermediation that could make quick resource allocation decisions based on their members' reputation and savings profile (McKillop et al. 2007; McKillop and Wilson 2011). Fischer (1998) argues that the common bond helped to develop trust within credit cooperatives which lowered transactions cost to the point where the credit cooperatives could operate sustainably. Economic and social value outcomes were realized from the credit cooperatives' innovative business model because they executed intermediation efficiently and used local knowledge of population demographics to meet financial needs.

Modern credit unions are an adaptation of Raiffeisen style credit cooperatives (Goglio and Kalmi 2017). Compared to credit cooperatives organized around the Schulze-Delitzsch model, Raiffeisen's rural credit cooperatives were characterized by closed and tighter common bonds, were run by volunteers, and offered longer term loans (Guinnane 1995). De Vicq (2022) argues

that the Raiffeisen credit unions were deemed to be more successful in tackling poverty because of how they made loans unlike the Schulze-Delitzsch institutions whose lending policy was more like banks.

From Germany, the Raiffeisen style cooperatives spread first to France in 1882. Credit Agricole and Credit Mutuel, which are significant French financial institutions, emerged from the Raiffeisen model (ICA n.d.). In 1901, credit unions were established outside Europe, in Canada and then in the United States in 1909. Between 1941 and 1946 credit unions emerged in several Caribbean Islands followed by institutions in Australia in 1946, the Republic of Ireland in 1958, and Northern Ireland in 1960. England, Scotland, and Wales had their first credit unions in 1964, 1970, and 1974, respectively. According to the British Credit Union Historical Society, formal savings and credit cooperatives were first established in Africa in 1955 (BCUHS n.d.). Different factors shape and structure the development of credit unions in a given country. These include the level of financial development of a country at the time credit unions were introduced, the regulatory regime for credit unions, the competitive landscape, and the business models that credit unions adopt (Ferguson and McKillop 1997; Jones 1999; NEF 2014).

Around the world, the traditional core product offering of credit unions comprises savings and consumer loans, reflecting that their primary mission continues to be meeting consumers' credit and savings needs (Getter 2021). However, the product range has expanded in many countries to include current accounts and transaction banking. In the United States and Canada, for example, large professionally run credit unions can offer a wide range of products that allows them to compete with banks (Anderson and Liu 2013; Chatterji et al. 2021). Yet, they continue to be formally differentiated from banks by their dual social and economic goals and membership of the global credit union movement. In the United States, a federal income tax exemption enjoyed by credit unions further differentiates them from banks (Frame et al. 2002; McKillop and Wilson 2015).

The Credit Union Movement

Credit unions are referred to as being part of a movement, rather than an industry. In industries, firms compete directly. Credit unions only compete directly for market share, in instances where their common bonds overlap (McKillop et al. 2002). Movements comprise groups of people who pursue change together (Johnston 2014). Using a typology developed by Morris and Braine (2001), the credit union movement can be classified as a social responsibility and self-help movement in which a group of people work together to challenge certain conditions that affect the general population. Movements seek to bring about social change by attracting and mobilizing resources and taking collective action. McKillop and Wilson (2015) emphasize the self-help nature of credit unions and their strong emphasis on building social capital and empowering their members and local communities.

According to WOCCU's 2021 statistical report, there were 86,914 credit unions established in 118 countries serving approximately 394 million people. The overall penetration rate of credit unions is 12.69%, which masks an uneven global picture. In Ireland, for example, penetration is as high as 113% while in other countries, like Armenia, it is less than 1%. Thomas et al. (2008) found that the ability to offer additional services, support from other socially oriented stakeholders, notably the Catholic Church, and a sustained commitment to social responsibility and development were significant contributors to the success of Irish credit unions.

Regionally, the Caribbean records the highest overall penetration at 68.58%, followed by North America at 51.77%. The regions with the lowest penetration are Oceania and Asia at 4.13% and 5.92%, respectively. Europe has just under 10% penetration at 9.64%. Although credit unions developed from German credit cooperatives, cooperative banks rather than credit unions are the dominant form of financial cooperatives in Europe (McKillop et al. 2020). Africa and Latin America record less than 20% penetration, with 15.66% and 16.5% penetration, respectively. Occupational credit unions are the largest in the

world, but non-occupational community credit unions, like Vancity Credit Union in Canada with assets of \$21.7 billion and Golden 1st Credit Union in the United States with assets of \$18.48 billion, have achieved significant size and reach within their fields of membership (Forbes 2022; Advratings 2022).

There is a roughly even split between male and female users at 47% and 51%, respectively. Group membership accounts for 2%. Most credit union users, 71%, are in the 45–64 years age brackets. Marshall and Nat (2015) and Kleanthous et al. (2019) have highlighted credit union membership is skewed toward older people, suggesting that credit unions may be less appealing to a younger clientele. Kleanthous et al. (2019) suggested that an explanatory factor could be a lack of cooperative education targeted at young people which leaves them unaware of credit unions. Larson (2021) and Dopico (2021) identify that credit unions face technological limitations. These limitations may make credit unions unappealing to younger clientele who have been found to be more interested in the newest banking technologies (Harris et al. 2016; Krasonikolakis et al. 2020). The lack of appeal to a younger clientele gives cause for concern about the ability of credit unions to engage with and meet the prevailing needs of future generations.

Credit Union Operating Principles

In its Statement on the Cooperative Identity, the International Cooperative Association (ICA) sets out its four values and the principles by which these values are operationalized (ICA 2012). These values are self-help, self-responsibility, integrity, and solidarity. To reflect the status of credit unions as cooperatives, WOCCU has drawn from the ICA's statement to develop a set of international operating principles that articulates how credit unions should work to serve their members and society (WOCCU 2017). The ten principles fall under three categories – cooperative structure, service to members, and social responsibility.

The first category specifies the three features that credit unions have in common with all other cooperatives, but it also recognizes that although credit unions are autonomous, they are regulated institutions. Like all cooperatives, credit unions are member-owned, member-controlled institutions and operate with a democratic mandate. Each member has one vote irrespective of the amount they have saved in the credit union. Democracy, therefore, plays a key role in credit union's internal governance (Amess and Howcroft 2001; Spear 2004; Labie and Perilleux 2008; Jones et al. 2017).

Service to members covers a further three principles that define how credit unions deliver their products and create value as financial intermediaries. These principles are financial inclusion, financial sustainability, and maximizing member economic benefit. Financial inclusion means that credit unions do not discriminate against anyone who qualifies to become a member. Jones (2006), McKillop et al. (2007), and Gregory and Drakeford (2011) are among those who have emphasized that promoting financial inclusion should not be at the expense of a credit union's financial sustainability.

WOCCU developed a financial monitoring and business planning system known as PEARLS in the late 1980s to help strengthen credit union movements throughout the world (Evans and Branch 2002; Richardson 2009). PEARLS uses target ratios for key areas of credit union performance that contribute to financial sustainability. These are **Protection of assets**, **Effective financial structure**, **Asset quality**, **Rates of return and costs**, and **Liquidity and Signs of growth**. Members' economic benefit is maximized through providing appropriate products and by pricing products reasonably and fairly. Economic benefit is also distributed through dividends paid to members. As they return profits to their members, the members' deposits are known as shares (Getter 2021). However, while all members would receive dividends, some members could benefit more than others from product availability and pricing, depending on whether a credit union is saver or borrower dominated (Legget and Stewart 1999; Labie and Perilleux 2008). The result is that maximum

economic benefit will not accrue to all. Paradoxically, while all members are equal, all member groups may not be equal. Only neutral credit unions that are neither saver or borrower oriented are likely to benefit all member group equally (Patin and McNiel 1991; Bressan et al. 2013).

The final category, social responsibility, deals with how credit unions address society's problems by using cooperation, making meaningful connections and building relationships to deliver social value. The principles are financial literacy, network cooperation, community responsibility, and global vision. These four principles take account of credit unions' external stakeholders and of how credit unions cooperate with each other and with cooperatives generally to impact positively on local and global communities.

Financial exclusion is a key social responsibility issue (Decker 2004; Amaeshi et al. 2007). Providing education about the benefits of cooperative finance is one way of promoting financial inclusion. To address financial inclusion effectively through education and products, empathetic cooperation and joined up solutions between credit unions and other actors is required. Empathetic cooperation occurs when different stakeholders, perceiving barriers or social problems, collaborate to formulate and implement solutions together. The extent to which credit unions adhere to all these principles is debatable. For example, as the membership of a credit union becomes more diverse and affluent, the credit union's involvement in those activities that are dedicated to serving the needs of the poorest may diminish. Kleanthous et al. (2019) found that credit unions in Cyprus do not apply cooperative principles universally, but van Rijn (2022) concluded that US credit unions continue to reflect cooperative principles.

Credit Union Governance

Niederkoher and Ikeda (2005) distinguish between external, internal, and individual aspects of credit union governance. Regulatory governance is the main form of external governance. Financial

regulation and supervision provide standards, constraints, and oversight that covers different aspects of business ranging from scope of activities to financial sustainability, risk management, and conduct. Among other reasons, deposit-taking institutions attract external regulation because of the risks of contagion, widespread disruption, and reputational damage that can occur when they fail (Llewellyn 1999). When a credit union sector is in the formative or nascent stage of development, regulation tends to be more restrictive (McKillop and Wilson 2011). Regulators, because of their views about the risks that a type of organization's business strategy can pose to financial stability and regulatory objectives, may seek to limit their activities (Barth et al. 2004; Chow and Surti 2011).

Internal governance relates to democracy in credit unions which is operationalized in credit unions via the one person one vote system. Theoretically, owners/members can exercise their voice and power through their voting rights (Holmstrom 1999; McKillop and Wilson 2011, 2015). The caveat here is that concentrated membership and dynamic participation are needed for members' voice to be effective as a governance mechanism. Change in the size and composition of the membership can weaken members' voice as a governance mechanism. Research has shown instances where member participation in cooperatives is weak and the power of membership voice is not used effectively (Goth et al. 2012; Kleanthous et al. 2019).

Individual governance covers the obligation of credit union directors and managers to execute their duties with skill and to behave ethically and professionally. Arguments of the advantages of credit union governance include that it produces trust, may reduce the incidence of opportunistic behavior and could ensure a higher level of corporate responsibility, which could give them a comparative advantage because of its stakeholder approach (Amess and Howcroft 2001; Arthur et al. 2007).

In not-for-profits organizations like credit unions, boards have a key role to play in managing relationships with different external issue-

centric stakeholders as well as addressing the balance between customer groups in the membership (Cornforth 2004; Labie and Perilleux 2008; Spear et al. 2009). Conflicts could exist between borrowers and savers because of the dominance of one group (Patin and McNeil 1991; Mercer et al. 2019). While a majority of members may save more than they borrow, or vice versa, a credit union must always strike a balance between policies that benefit savers and those that benefit borrowers. If policies are skewed in the direction that benefits one group, it may be difficult for the credit union to remain a strong institution (Bressan et al. 2013; Vinh Vo et al. 2021).

At the heart of sustainability and sustainable management is the ability to deliver value for multiple stakeholders over time. Spear (2000) proposed that because credit union managers do not have pressures to distribute profits to external shareholders, they should be less opportunistic and less likely to exploit owner-members, particularly the vulnerable members of society. However, there could be a divergence between the interest of managers and the general interests of members. The directors are elected by members to vouchsafe their interest and play a stewardship role that requires them to collaborate with rather than control management. The board of directors is ultimately responsible for oversight of developing product market strategies that deliver sustainable growth, financial sustainability and social outcomes. Management of conflicting demands of stakeholders is essential to address the risk of drift in strategic direction to which organizations with social and economic goals are prone (Ebrahimi et al. 2014; Cornforth 2014).

Credit Unions and Inclusive Banking

The societal concerns that credit unions emerged to address impinge on sustainable development. Unequal and unfair treatment of consumers of financial services, high debt levels, restricted access to mainstream banking products, high-cost lending, health problems associated with financial difficulties still challenge society.

Financial exclusion is typically associated with income inequality and biases that are prevalent among certain groups in society, notably women, older people, minorities, and people with disabilities (Cihak and Sahay 2020; Aslan et al. 2017). Furthermore, the use of financial services is much more widespread in contemporary societies making it imperative for people to have access to financial services, if they are to participate fully in economic life (Martin 2002; Appleyard et al. 2016).

To realize their potential to address sustainability concerns through offering inclusive banking, credit unions need to reach more people and deliver on their capacity for impactful inclusive banking. Credit union penetration in most countries is low, requiring efforts to modernize and grow the movement globally. Jones (1999) argued that a combination of well-designed and targeted products and institutional measures that enhance a credit union's financial sustainability and capability to accommodate growth are crucial. In Britain, modernization of the credit union sector has been based on these principles (Jones 2008a, 2016; Decker 2010).

From a product perspective, access to banking, savings, affordable credit, and insurance products are the key elements of financial inclusion (HM Treasury 2007; Prabhakar 2022). Many credit unions cannot provide a full range of products due to capacity, operational, or regulatory constraints. They may need to work in partnership with other stakeholders to address these constraints. Collaborations may range from working with banks to access the payments systems or forming a credit union consortium to share the costs and risks of developing a new product. Jones (2008b) provides an account of how British credit unions formed a consortium to introduce current accounts. In all collaborations, it is important for a credit union to maintain and communicate a strong sense of identity and purpose to avoid strategic drift. This is because different understandings may exist across partners about the purpose and nature of credit unions. For example, the British government and some other stakeholders presented a view of credit unions that

either located them between banks and payday lenders or as alternatives to payday lender or as institutions that serve only the financially excluded (HM Treasury 2014; Lee and Brierley 2017).

For credit unions to continue to offer inclusive banking, they need to ensure that both the services they offer and the processes through which they are developed and distributed are useful to people, communities, and society. This means that apart from being nondiscriminatory, their services should not have detrimental impacts. Product governance aims to ensure that product development is responsible by providing oversight of the processes adopted when designing, manufacturing, and distributing products. The financial regulators' approach to product governance defines responsibility in terms of detriment to the customer (Bafin 2018; FCA 2023). It does not consider some product related responsibilities that arise when organizations have both economic and social goals or when there is an overlap between owners and customers.

Credit unions are susceptible to some governance failures in the area of product development. Product development is a means of value distribution, especially in credit unions where dividend payouts are low or where members' accounts do not attract interest payments. Inequitable value distribution can occur because of the domination of a particular customer groups. In order to distribute the surplus of a credit union in an equitable manner, it is imperative that the range of products that is available caters for different customer groups. An unbalanced focus on developing products for the unbanked would create a reputation of credit unions as "poor people's banks" that cannot adequately serve other customer groups (Jones 2008a; McKillop et al. 2011; Myers et al. 2012).

A second governance consideration is the likelihood of a drift in a credit union's strategic direction. This could occur because of conflicting demands of stakeholders and a high level of resource dependency of a particular credit union or the entire movement in a particular country. If resource dependency is high, a credit union may embark on collaborations that prioritize the

poverty or inclusion agenda of external stakeholders. Fuller and Jonas (2002) and Davis and Bockie (2001) highlight how partnerships between credit unions and the British government to address financial exclusion created tensions between the credit unions' autonomy and national legitimacy.

There is a fine balance between governments' partnering with credit unions to promote inclusion and limiting them only to achieving inclusion through poverty alleviating projects. The latter runs the risk of stigmatizing credit unions as institutions for poor people and preventing them from achieving the mix of members that is needed to support their financial sustainability. Rather than being inclusive, a credit union would become exclusive. Some commentators have warned that if credit unions are seen only as instruments to serve the needs of those who have little or no access to mainstream banking services or to compete against predatory lenders, then they will not develop into large, viable institutions because of this insularity (Ryder 2002; McKillop et al. 2007). Inclusive banking challenges credit unions to adopt a progressive universal approach by which they can adapt products to meet the needs of those who are excluded rather than create a separate suite for them (Gregory and Drakeford 2011; Decker 2021).

For credit unions, it is worthwhile to approach product development and accountability from the perspective of managing multiple stakeholders to maximize benefits for all groups and minimize conflicts. Inclusive banking involves being explicit about values *and* standards that are adopted to deliver services and their outcomes (Decker 2021). To maximize social and economic benefits, accountability to multiple stakeholders should be a priority. Accountability to membership and regulators is captured in the WOCCU principles, but accounting for social performance to a wider range of external stakeholders has not been widely practiced (Hyndman et al. 2002; McGrath 2008; Nembhard and Ketilson 2015). Without much external scrutiny of credit unions' social impact, their social credentials can easily be taken for granted.

Reporting on financial performance alone is unlikely to sustain attention on or motivate action

toward improving sustainability performance. Developing management information systems and metrics that can measure and inform readily on the social value added by a credit union will facilitate an evaluation of the extent which they remain true to cooperative values and WOCCU's operating and governance principles.

Summary

Credit unions are considered to have the potential to use relationship banking in local communities and appropriate products to contribute to the global pursuit of equality, welfare improvements, and sustainability. From their origins as cooperatives that emerged in response to the exclusion and disadvantage of particular groups in society, credit unions have become an integral part of financial systems and societies, offering choice and social value. Over time, they have developed and changed as they adapted to suit the specific contextual realities of the environments in which they exist. Their evolution confirms that appropriate products and the ability to reach into communities are key to promoting financial inclusion.

Credit unions' ability to continue playing a key role in building inclusive societies cannot be taken for granted. Whether credit unions can realize their full potential to contribute to sustainable development depends on several factors. These include their own financial sustainability, their ability to manage the risks that are inherent in lending to the unbanked, and those on low incomes and their ability to manage complex stakeholder relationships internally and externally. Credit unions' overlapping stakeholder constituencies present important challenges especially when considering the creation of value through the product offering. Case study research at country level into how credit unions manage conflicts, what resources and capabilities contribute to their strategic successes, and how they apply their unique cultural values would enhance contextual understanding of their challenges and how these could be addressed.

Crisis Management

Eva Maria Katharina Koscher and Lars Schweizer
Goethe-University Frankfurt am Main, Frankfurt, Germany

Definition

Crisis management deals with endeavors to detect and foresee areas of potential crises, the development of activities and procedures designed to prevent crises from occurring or from an incident developing into a crisis, and minimizing the negative effects from a crisis that could not be prevented (Wilson 1992).

Introduction

In a business context, a crisis can be defined as a situation triggered by significant internal and/or external factors or by the escalation of smaller incidents that (1) has an enterprise-wide, multi-functional impact, (2) creates disruption in normal business operations, and (3) has the potential to harm the company’s reputation (PwC 2019). Crises are “either low probability or high consequence events that jeopardize the most fundamental goals of an organization” (Weick 1988). A crisis can have its roots in an organization’s external or internal environment (Perrow 2011). Examples are natural catastrophes like a fire or a storm, a security breach, a labor strike, or food poisoning (Miller 1987).

A crisis can strike any organization at any time (Vassilikopoulou et al. 2009). In a recent study conducted by consulting company PwC, 1430 out of 2084 senior executives in organizations reported that they had experienced at least one crisis in the past 5 years (PwC 2019). As such, crisis is now considered to be a common part of business (Kim 2014). Mitroff and Harrington (1996) has outlined that it is not a question of “if” a business will face a crisis but, rather, a question of “when,” “what type,” and “how prepared” an organization is to deal with it. If the

organization does not respond to the crisis immediately and in the right way, then the crisis can escalate into a catastrophe (Davies and Walters 1998). Irrespective of their severity, crises pose a serious threat to organizations. The factor that decides how well a company will endure a crisis is its capability to respond to that crisis (Vassilikopoulou et al. 2009). While some financial losses and reputational damages might be inevitable once a crisis happens, effective crisis management, defined as a series of functions or procedures to recognize, study, and forecast crisis issues, and set forth specific behaviors that would enable an organization to prevent or cope with a crisis (Darling et al. 1996), helps to control the negative effects and to protect the company's reputation (Stafford et al. 2002).

Crisis-Mitigating Strategies

One if not the important question when it comes to crisis management is: What can organizations do to identify potential crisis situations and to minimize risk? Research has suggested that some organizations are more likely to experience a crisis from the way they are managed and from the nature of the organization itself. Mitroff et al. (1989) have outlined that there are critical differences between organizations when it comes to their particular cultures, beliefs, and assumptions and that organizations could be described as fitting somewhere along a spectrum of being crisis-prone or crisis prepared.

- Crisis-prone organizations perceive crises as random or bad luck. The crisis-prone organization is egocentric, and this perception will limit its pre-preparedness (Davies and Walters 1998).
- Crisis-prepared organizations adopt both technical and behavioral actions to prepare for and manage their way through a crisis. They feel as part of a wider system of customers, suppliers, community, and shareholders and adopt a crisis management tactic since they accept that an elementary property of complex systems is to fail (Davies and Walters 1998).

Organizational strategies to become crisis-prepared and to mitigate risk and crisis often include the following:

- To set comprehensive and institutionalized norms and rules for handling safety problems
- To generate appropriate beliefs and assumptions constituting a corporate attitude toward safety
- To educate and train in safety culture
- To provide feedback to practitioners from incidents
- To use specialists, but supervise with widely experienced generalists (Davies and Walters 1998)

It must, however, be emphasized that despite all of the efforts an organization can put forth to mitigate risk, crises can occur and have to be managed (Kash and Darling 1998).

Managing Product-Harm Crises and CSR

One of the most common corporate crises is product-harm crises (Davidson and Worrell 1992). A product-harm crisis is defined as a well-publicized crisis concerning products which are faulty or not safe (Dawar and Pillutla 2000). Research found that many business leaders think that product safety-related crises have the greatest negative impact on corporate reputation (Kim 2014), but also that a positive corporate reputation built prior to a crisis could at least mitigate the negative impacts inflicted by a crisis (Dawar and Pillutla 2000; Grunwald and Hempelmann 2011). Especially, having positive prior corporate social responsibility (CSR) associations seems to be beneficial to a company in a product-harm crisis (Kim 2014).

Leadership During a Crisis

A crisis can throw an entire organization off track. It often takes organizations days, weeks, or even months to deliver an effective response, and even then, the responses often lack a long-term vision,

discipline, and structure (PwC 2019). To overcome this hurdle, a strong leader can help an organization (see also ► “Leadership”).

In a crisis, “leaders serve as a repository for people’s fears. Leaders can also act as a mirror reflecting a group’s anger, grief, resolve or joy on a much larger stage than is available to most. Leaders say in effect ‘I hear you’” (Useem 2001). Research has outlined that leaders are essential to lead organization through a crisis since managing a crisis by consensus does not work – short time, threat and the surprise elements of most crises imply that tough decisions need to be made quickly which leaves no room for discussions or evaluations on a broad scale (Sapriel 2003). Leaders (or leadership teams) can provide a vision of the aftermath of the crisis and rally all members of an organization under a mission.

In a recent survey, 91% of CEOs said they are in charge when a crisis hits, but 65% of CEOs also said that they feel most vulnerable about their ability to gather information quickly and accurately during a crisis (PwC 2019). Having implemented the right structures and behavioral norms (see above) before a crisis hits helps to overcome such problems.

Summary

A crisis is a critical situation that, if mismanaged, can inflict severe damage on an organization (Vassilikopoulou et al. 2009; Arpan and Pompper 2003). Crisis management is a discipline within the broader context of management. It aims to develop and manage skills and techniques required to identify, assess, and cope with crisis situations. Special attention is given to crisis-mitigating strategies, to the management of product-harm crises and CSR topics, as well as to leadership during crisis.

Critical Corporate Social Responsibility

Ioannis Φ. Panagiotopoulos
Department of Business Administration,
University of the Aegean, Chios, Greece

Synonyms

Urgent CSR

Definition

The term Critical Corporate Social Responsibility (Critical CSR) has been suggested by Dr. Panagiotopoulos during the pandemic through his article “Novel CSR & novel coronavirus: Corporate Social Responsibility inside the frame of Coronavirus Pandemic in Greece” (Panagiotopoulos 2021). CSR is popular as big international corporations obtain more power than states and public society expects from them to behave as corporate citizens and contribute to several issues that burdens society and environment. This is also the case for the pandemic of novel coronavirus, COVID-19 that threats public health and global economy since the end of 2019. A big number of international firms have announced urgent CSR programs to protect their employees and local communities where they are active. The researcher has recognized the formation of a new type of CSR that comes up as a hybrid between the two main types of tactical and strategical CSR sharing characteristics from both. Critical CSR is a universal kind of CSR created

under the unprecedented conditions of the pandemic and the ensuing financial depression since similar corporate urgent CSR actions have been implemented worldwide.

Critical CSR is this type of CSR that is developed during unprecedented and critical circumstances that threat society and economy like the pandemic of COVID-19. Critical CSR is a hybrid between tactical and strategic CSR and the characterization of criticality refers to its ontological character since the pandemic threats humanity and economy either with the form of employees or customers. When commercial game is under threat of extinction this hybrid CSR is crucial and inevitable, and its value is critical for society, economy, and the company itself (Panagiotopoulos 2021).

Introduction

The last decades of twentieth century and at the beginning of twenty-first century there was a significant development in the theoretical complex of CSR. There have been suggested various definitions and criteria for categorization of CSR based on discrete aspects. CSR is the concept that calls corporations to consider social and environmental concerns to their decision-making process (European Commission 2001). CSR suggests the incorporation of sustainability principles by a company in order to achieve an equilibrium among (a) economy, (b) society and (c) natural environment (Elkington 1999) using the prism of Ethos (Carroll 1979, 2016; Frederick 1998) with its ancient Greek meaning. Ethos or ethics in modern English refers to a moral character who can distinguish good and bad, right, and wrong, and continues doing the right, good, ethical thing (Eisenstein 2020).

CSR comprises a set of actions that exceeds the simple compliance with the legislation and goes beyond the profit persuasion. However, designers of CSR policies are stimulated by the existed regulations and are inspired from statutes. Big size firms must develop CSR strategies that materialize their sustainability values even in the execution of their core activities under the usual conditions of a globalized world. However,

modern world is confronted a non-ordinary challenge, the pandemic of COVID-19. This pandemic has been proved an unexpected circumstance even though humanity has faced two more coronaviruses during twenty-first century having as main effect respiratory disease outbreaks and finally death. SARS developed in 2002 in China and MERS came up in 2012 in KSA. COVID-19 was first detected in China in 2019 and up to end of May 2020 had been spread all over the world except Antarctica. Both SARS and MERS were characterized by higher fatality rates than COVID-19 but the last achieves much easier dispersion causing millions of cases and deaths. World Health Organization (WHO) declared COVID-19 officially as a pandemic on 11th of March 2020 (Hewings-Martin 2020).

All governments have taken precautionary measures including several types of social distancing and lock-down to their societies and markets, respectively, targeting to break the chain of person-to-person dispersion. Although this pandemic concerns initially the health sector, it causes tremendous side effects in economy since these precautionary measures limit economic and commercial activities. Finally, this pandemic is transformed into an explosive mix that strokes public health and global economy on the same time. Such side effects of coronavirus are spread in every sector of economic activity, in primary, secondary, and tertiary sector since social distancing, disease, and deaths affect the occupation of workforce, disrupt the buying mood of consumers, and descend the psychology of the whole market. Indicatively there is decrease in agricultural production concerning the primary sector, reduction in the production of cars regarding the secondary sector, and extensive crisis in air transportation and tourism that burdens the tertiary sector.

The pandemic of COVID-19 has developed symmetrical characteristics because it hits evenly: a) the demand for goods and services and b) the demand and the offer of them (Panagiotopoulos 2021).

Consequently, companies must deal with the menace of coronavirus to society and global economy by altering their business plans under the

new pandemic conditions keeping their personnel, customers, suppliers, and rest stakeholders safe, protecting their profitability on the same time. This dual problem creates a challenge for companies that must prove their social sensitivity by designing Critical CSR programs for their employees and society (Panagiotopoulos 2021).

Theoretical Framework

Generally, companies design CSR programs that are categorized as strategic or tactical CSR. Strategic CSR concerns the embodiment of CSR principles and stakeholders' interests within a firm's strategy and everyday operations. Thus, the company is managed in the interests of a broad set of stakeholders to achieve maximum economic and social value over the medium to long term. Tactical CSR on the contrary refers to short-term managerial decisions about CSR programs of limited resources and minimal impact to company's everyday operations (Werther and Chandler 2006). Tactical CSR is planned to facilitate stakeholders' relationships with the organization in the short-term. Tactical CSR programs demand less resources, do not imply significant changes in firms' structure and operation. Therefore, tactical CSR programs could be designed and implemented swiftly, and they are usually reversible. Contrariwise, strategic CSR involves bigger commitments in budget and personnel, presupposes medium to long horizon for planning and execution, influences firms' operation and structure. Consequently, strategic CSR programs are more idiosyncratic to the organization, difficult to be copied by competitors, and reverse when business and economic environment is transformed (Bansal et al. 2015).

CSR is classified according to motives and actions held into three types: (a) ethical CSR, (b) altruistic CSR, and (c) strategic CSR. Ethical CSR in short focuses on firm's responsibility to avoid any detrimental action against society and environment (Carroll 1991). Altruistic CSR is a more advanced type by indicating exactly what ethical CSR does plus firm's contribution to current issues of society like carrying out

philanthropy even by having a negative financial impact on them (Lantos 2011). Strategic CSR goes one step further by considering that the satisfaction of firm's stakeholders operates as a necessary condition to fulfill firm's traditional goals for profitability (Jones 1995; Mc Williams and Siegel 2011).

A relevant term is Corporate Social Performance (CSP) that focuses on the quality of corporate efforts to execute the designed CSR plan. A definition suggested by D. Wood (1991) considers CSP an arrangement of CSR principles, processes of social responsiveness, related policies and programs. The evaluation of CSP operates as an answer to the question of how much a firm has embraced CSR principles and how intense are firm's efforts to implement its designed CSR policy (Panagiotopoulos 2021). Accordingly, there is a three-levels stratification of companies as: (a) reactive, (b) responsive, and (c) interactive (Preston and Post 2013; Sethi 1979) based on the nature of their CSP. A company that reacts in an issue for which its activities have a detrimental impact and takes actions to correct it could be reactive and its CSP is limited on that specific issue. A responsive firm has a stronger CSP than a reactive firm because it responds to relevant calls from public society to contribute to problems that may not be relevant with its activities. An interactive firm has already recognized the sphere of its stakeholders and has established channels of communication with them, thus there is an interactive relationship and a constant cooperation for sustainability issues independently whether they have direct or indirect connection with its core operations.

The alignment of a company's operation with the legislation belongs to ethical CSR and indicates a reactive company. Proportionally, corporations that pay attention to social issues which are either directly or indirectly interwoven with their operation develop altruistic CSR policies and are characterized as of responsive type. Last, an interactive company moves further by applying strategic CSR and develops significant CSP. From a different perspective, CSR concerns a firm's environment which could be categorized in internal and external environment. The internal

environment comprises mainly its employees and the external environment encompasses its customers, suppliers, partners, etc. and society in general (Carroll 1979; Cornelius et al. 2008; Werther and Chandler 2006).

It is expected the urgent CSR programs of companies during the pandemic could be classified either as strategic or tactical CSR. The plethora of CSR actions by international companies to tackle COVID-19 has offered a wide spectrum of urgent CSR activities for perusal. If these urgent CSR programs could be categorized either as tactical or strategical, based on their characteristics, probably there is no space for Critical CSR. On the contrary, if these brand-new CSR actions are not fit for the available definitions may the proposed term Critical CSR contributes to theoretical background of CSR.

Panagiotopoulos (2021) supports that this urgent CSR activity of firms due to the pandemic belongs neither in tactical nor strategical CSR policy of them. This new type of CSR called critical CSR since it is inescapable and crucial during this global crisis. It is the product of corporations' reaction and response to a brand-new phenomenon, a worldwide pandemic that causes a global financial depression too. Critical CSR is momentous since it assists employees and customers, society, states, and firms themselves to stay safe and withstand during this pandemic. This brand-new, universal type of CSR is necessary for companies and consists a chance for initiatives because whether they lose the opportunity to react properly and confront this pandemic, the governments will establish a strict legislative framework. Principally, critical CSR is inevitable having intense ontological nature because public health and global economy are under threat and firms should defend their human resources, their clients, and their market. If these factors face a serious threat, consequently, the financial game faces the fear of extinction. Eventually, critical CSR intensifies and upgrades CSR concept. Various characteristics of critical CSR could be exploited after the end of this crisis to reinforce the usual CSR strategy of corporations (Panagiotopoulos 2021).

Critical Corporate Social Responsibility, Table 1 Interconnections among several types of CSR (Panagiotopoulos 2021)

Theoretical analysis of critical CSR programs due to coronavirus			
Type of planning	Tactical or strategic	Tactical or strategic	Critical: both tactical and strategic
Types of CSR (Carroll 1991)	Ethical	Altruistic	Strategic
Type of company (Preston and Post 2013; Sethi 1979)	Reactive	Responsive	Interactive

The interconnections of the various terms about CSR types are presented in Table 1 (Panagiotopoulos 2021). Furthermore, Critical CSR becomes part of this theoretical complex proving that it operates as addendum of the existed theory and fits well with the already established concepts. As per Table 1 a reactive firm applies ethical CSR as part of a tactical or strategic CSR policy. A responsive firm implements altruistic CSR as part of a tactical or strategic CSR policy. The brand-new Critical CSR refers to strategic CSR and no to ethical or altruistic CSR because the pandemic is not a problem caused by its operation. Moreover, Critical CSR indicates an interactive type of company that has not exclusively implemented a simple donation to vulnerable groups or to the National Health System (NHS) due to the pandemic. Critical CSR encompasses for example big donations of specialized medical equipment of high economic value that designed in extremely short time under the unprecedented conditions of a pandemic and an economic recession, in cooperation with the NHS of a state. Furthermore, Critical CSR includes special CSR programs like the restructuring of production lines to cover needs created due to the pandemic and provisioning of the market with crucial products for the pandemic in reasonable pricing under agreement with the states.

Reciprocating CSR

The results generated from these urgent CSR actions could be very positive for firms

concerning both their internal and external environment. Several benefits accrue and support the reciprocating character of Critical CSR.

Concerning the internal environment of firms, the employees feel that their employer is caring for them and the society in whole. They feel satisfaction because their employer has listened their concerns about their safety. They could be proud because they contribute to the announced donations and other Critical CSR programs since they are part of their corporation and the distributed profits to society consist the results of their efforts. A new relationship could be established between employees and employers, characterized by the elements of loyalty and strong communication (Hameed et al. 2016). On the external environment of the firm, society appreciates companies that contribute to public issues and share their earnings with it, especially during a critical situation like a pandemic. The brand of a firm becomes more prestigious, and the firm earns respect from people who appreciate firm’s CSP for COVID-19. A socially sensitive profile is building and a new relationship with society and finally the market is constructed. Thus, Critical CSR activities increase firm’s external prestige and deepen internal respect from employees to their firms (Hameed et al. 2016).

If the previous economic crisis of 2008–2009 was about trust among people, firms, and governments (Sapienza and Zingales 2012; Stiglitz 2008), this double financial and health crisis is the chance for corporations to build the trust needed for their sustainable development. In the aftermath of the recent international financial crisis, there was a decline in public trust in

firms (Lins et al. 2017). Firms with strong CSR footprint manage to keep a better image during the severe recession when overall trust in companies was low. CSR in general enhances the trust among a firm and its stakeholders and increases its social capital. The experience from the recent depression of 2008–2009 have offered evidences for this reasoning although this connection predates the depression (Fitzgerald 2003; Lins et al. 2017).

Furthermore, modern researchers corroborate that CSR programs do not undermine the profitability of firms especially in case of strategic CSR as they manage to perform better in stock markets having higher stock returns in comparison with firms with much lower CSR footprint (Duchin et al. 2010). A lot of researchers support that there is a kind of reciprocity among a firm and its stakeholders. When a firm considers its stakeholders in decision-making processes and make investments for them, these stakeholders return a benefit with several tangible and intangible ways back to the firm (McWilliams et al. 2006). CSR in general, not exclusively Critical CSR, enhances the trust among a firm and its stakeholders and increases its social capital. Every action in the global bid to curb COVID-19 by the firms belongs in the field of civic engagement and thus maximizes their social capital (Scrivens and Conal 2013).

Especially in times of crisis a firm with increased social capital and organizational identification due to well established CSR strategy is more resistant due to its customers and rest stakeholders support (Ducassy 2013; Lins et al. 2017). This specific crisis that consisted by health and financial issues due to the pandemic offers a chance to companies to reconsider their CSR footprint and invest in their social capital by helping NHSs and people. This investment could be seen as an insurance policy for the foreseen financial downturn since a firm has the chance to be recognized as identifiably trustworthy significantly based on the conclusion that during the recent crisis of 2008–2009 companies with intense CSR activity performed better than others (Lins et al. 2017).

Epilogue

Although the current crisis has not as main characteristic a lack of trust to international markets and firms, there is strong skepticism of WHO's reactions, coalition of states' inertia, governments' choices, vaccinations policies, and the overall reaction of states and other authorities for COVID-19. Moreover, public society is concerned about firms' reaction to the pandemic and the forthcoming recession especially for layoffs. In the USA, the number of unemployed people due to the pandemic implications to the market was 20.5 million only in April of 2020 and this rise marks the worst jobless rate than the Great Depression of 1930s (US Bureau of Labor Statistics 2020). A lot of concerns have been raised that this pandemic could cause finally a kind of humanitarian crisis in both developed and developing world. Issues like the increased number of job loss due to global recession, food insecurity, and lack of personal protective equipment (PPE) for COVID-19 especially in areas where humanitarian response plans take place could harm further already vulnerable and burdened groups of people (United Nations 2020). Thus, the capacity of being trustworthy during an unexpectedly low-trust and high-risk period is valuable.

Critical CSR marks a paradigmatic management of such an unprecedented situation with a double health and financial crisis and provides data about modern firms' flexibility to adjust to turbulent conditions, its reactions to risk by investing in CSR in the threshold of a global recession, its ability to reform existed CSR policies promptly to catch up pandemic high pace of development, its long-range planning, and its willingness to support community. Finally, coronavirus era could be deemed as a chance for corporations to invest in Critical CSR programs, orient their business model toward sustainability, obtain a competitive advantage in comparison with the competition, and enhance their resilience to the forthcoming recession *ex ante* rather than *ex post*.

Summary

The pandemic of COVID-19 has caused very serious implications in public health, society, and economy. Corporations face unprecedented conditions, and they must survive amid a strong recession. Additionally, scheduled CSR programs are canceled or postponed due to the pandemic and the economic crisis. However, various stakeholders of firms expect from them to continue acting as corporate citizens and take precaution measures to protect their internal and external environment by supporting their employees, their customers, their partners, and society in general. Some corporations have managed to take initiatives to support public health by developing new unscheduled CSR programs like altering their production lines to produce critical products for the confrontation of the pandemic and donations of critical medical equipment. Companies have developed a brand-new type of CSR called critical CSR as their answer to the pandemic. Critical CSR is a universal phenomenon that comes up as a hybrid between tactical and strategic CSR. It enriches the theoretical background of CSR and offers useful services to states, societies, and the firms themselves.

Definition

Borders historically constitute spaces of conflict, lines of separation, and administrative elements between states that have promoted constraints and barriers in the forms of relationship and articulation between neighboring countries or regions but separated administratively by a border line. “The development of cross-border zones presents considerable problems, generally spanning two different nation-states, each with their own legislation, administration bodies, tax and labor regimes, and frequently with different languages and other important components of identity” (Gualda, Frago, & Lucio-Villegas, 2011:24). They represent spaces that oscillate and positioning themselves between cooperation and conflict, building a geographical stop with its own socio-cultural and economic value, as a result of the different political and administrative interests that, over time, establish different meanings and forms of territorial appropriation. Due to their

geographical and administrative characteristics, they advocate processes of connection and interaction between their populations, with territorial effects beyond their political boundaries. The perceptions and conditioning of the border, linked to the barriers that these spaces embody, in articulation with the supports and programs developed, foster a growing relationship. This convergence and cooperation is the result of the approximations generated by physical and technological communication, but above all by the political approximations and institutions that work in these regions (public and private).

Socio-economic and administrative changes, along with the strengthening of information technology, fostering cooperative relationships of integration, are changing the role of the border, in order to reduce the disturbances and weaknesses that are associated with the management of cross-border areas, particularly in peripheral spaces. However, developmental inertia and disruption in governance and promotion continue to occur. In fact, the border regions of peripheral territories have structural disadvantages, depending on their relationship with the decision-making centers, their ability to mobilize and valorize resources, their territorial articulation, and the existing fiscal, labor, and cultural differences. Cross-border cooperation (CBC) seeks to strengthen flows, proximities, and synergies, promoting development dynamics or reinforcing existing good practices. "It becomes fundamental to reflect on cross-border cooperation, a process that is based on a more or less institutionalized cooperation between sub-national authorities with the aim of overcoming the various barriers created by national borders" (Perkmann, 2003:55).

Introduction

Borders represent in practice limits, whose history and geography reveal spaces of tension and even conflict with existing interests, constituting as barriers and simultaneously spaces of cultural hybridity. The borders corresponding to

peripheral regions far from areas of administrative decision-making and strong economic dynamism present penalizing indices of development, which should be the target of policies and programs that allow their reversal. The different context costs, positioning in relation to the larger economic dynamism, has contributed to its fragility and development support to promote employment and social well-being of their communities. In this context, border equity implies a perception of territorial specificity and cooperation, allowing border populations to access infrastructures, services, and equipment that guarantee equal opportunities and access to supplies and services. The knowledge of the territory's differentiating elements, the present context costs, and the innovation processes, allow communities to strive for greater social and economic equity, capable of fostering action processes adjusted to their realities/specificities and desires.

Meaning of the Border Region and Elements for Its Equity

As regiões fronteiriças significam espaços de delimitação territorial, linhas de separação entre estados construídas por meio de elementos geográficos ou por definição administrativa. They represent in practice limits, whose history and geography reveal spaces of tension and even conflict with existing interests, constituting as barriers and simultaneously spaces of cultural hybridity. The different context costs, positioning in relation to the larger economic dynamism, and cultural inertias has contributed to its fragility. In this context, border equity implies a perception of territorial specificity and cooperation, allowing border populations to access infrastructures, services, and equipment that guarantee equal opportunities and access to goods and services.

Over time, the border has constituted a barrier, not yet effectively overcome, which, in addition to the administrative delimitation between countries, represents cultural differentiation, levels of remuneration, public policies, taxation, and access to services, among others (Fernandes & Natario, 2014; Medeiros, 2018). In this context, programs and support have been created to minimize these

effects, to enhance the cohesion of these territories, and their value as internationalization spaces.

The changes and new positions, resulting from technological, economic, and social transformations, have fostered a growing interrelationship between territories, their economies, and policies, in a process of greater relationship and integration. The role of borders and their narratives of territoriality and national identity tend to become more sophisticated through cooperation and support programs, in order to mitigate the effects of their administrative specificities and associated contact costs (Lange, 2012; Medeiros, 2016). It should be noted that border regions are multi-peripheral in terms of their geographic positioning, their effective territorial integration, structural disadvantages, and the latent conflict between policies and levels of development (Hidalgo, Dominguez, & Benzinho, 2014).

Recognizing the territorial specificity of these regions and the structural problems, an approach and the development of interventions that generate greater social equity and territorial participation in the construction of greater cohesion are required. There is a growing concern and institutional and citizens' dynamics to "annul the border effect" through greater mobility, joint valorization of resources, defense of heritage, incentive to cooperation despite the continuous depopulation, aging, and weakening of the economy.

Thus, it can be seen that cross-border cooperation efforts have not achieved the main objectives of development and territorial cohesion desired. "There are still some difficulties arising from national policies, development asymmetries between nations, administrative and fiscal differences, and also their own historical inertia, which continues to feed fears on both sides of the border" (Fernandes & Natario, 2016:61).

"The border does not disappear as identity with the physical separation line, but it can acquire new meanings for those who live there every day" (Pires & Lange, 2016:90). The connotations and perceptions that the border space receives are variable and circulate according to the need of the times, existing policies, and international

contexts. According to the occasion, the border is perceived – and said – as a local space, including territories on both sides of the dividing line as a single. At other times, the border is designated as an international place. In the border regions, cooperation is a vitalization and cohesion factor, fostering policies and programs that tend to attenuate the weaknesses that these dividing lines tend to represent and assume, promoting territorial equity (Fath & Hunya, 2001; Gualda et al., 2011). Cross-Border Cooperation (CBC) has been, within the objectives of the European Spatial Development Perspective (ESDP), a relevant process in making sustainable growth and territorial cohesion operational within the EU (ESPON, 2007; Medeiros, 2010, 2018).

The CBC has fostered agility in cross-border development relations between states, regional and local administrations, and between business and social associations, stimulating initiatives for cross-border rapprochement and cooperation (CPC, 2014; Medeiros, 2010; Salgado, 2010). These initiatives are presented in a context of transversality, solidarity and cooperation, strengthening the articulations in the territory and the players.

The border, due to its territorial specificity, requires a governance system based on approximations and compromises, solidarity and sharing, in order to generate synergic and resilient action contexts that promote collective benefits. Given their reduced dynamics, which is reflected in behavior of loss of demographic and socioeconomic vitality, with values well below national averages, these regions have been a major concern for development and cohesion in the European Union (Arencibia, González, & Cortés, 2013; Caramelo, 2007; EPSON, 2017). In this context, the EU has promoted programs and funds for the development and cohesion of the border, seeking to cancel the effects of peripherality and the contexts of proximity with strong economic and social differentiations.

The desired development and cohesion require forms of resistance and explicit cooperation, based on identities, economic assets, and ecocultural values in relation to the increasing

Cross Border Equity,**Fig. 1** Promoting factors of permeability, cooperation and territorial cohesion in border areas

rhythms of globalization (Faludi, 2010; Fragoso, 2009).

We have assisted to strategies to reduce the border effect, which has promoted and facilitated mobility among peoples and increased institutional relations, through policies, cooperation programs, community involvement, and the establishment of formal and informal channels of cooperation and rapprochement (Calderón, 2017; Domínguez, Aliste, Martínez, Natário, & Fernandes, 2013; Fernandes, 2019). Of these processes, it is worth mentioning: Increased mobility and transit infrastructure; strengthened political and institutional relations; increased social and cultural collaboration; community interest in partnerships and cooperative relations; administrative efforts to establish a basis for border collaboration; reduced mental perception of the border as a barrier (Fig. 1).

Territorial specificity and constraints in territorial valorization strategies, particularly in border areas, require economic, social, and territorial cohesion, with the definition of specific policies

of valorization and qualification, based on the territorial factors of the territory, the promotion of functions and generation of social equity in the search for regional development. Formal and informal relations, the development of common initiatives, the sharing of equipment and services, have contributed to the approximation and blurring of the border as an administrative representation.

Borders live in the permanent challenge of generating balance and sustainability of territorial development, promoting their position as an “international” space and ensuring the well-being and social equity of their communities. They require the recognition of their specificity and the necessary preservation of their resources (natural and cultural) and the promotion of border cohesion and equity. This requires the development of joint territorial management instruments (between the countries involved) and the encouragement of close and effective cooperation between institutions, businesses, and citizens.

Summary

Borders correspond to territories of specificity, where different policies and forms of governance collide, which require approximation, commitment, solidarity in the search for synergies, and collective benefits. In the context of the EU, land borders require the development of support programs, mobility and permeability policies, the promotion of infrastructures and facilities that guarantee equity for their communities, the capacity for resilience in the face of the costs of inherent contexts and the challenges of territorial cohesion.

Definition

Corporate social responsibility has become the cornerstone of a firm's strategy globally. Irrespective of a firm's size, Corporate social responsibilities (CSR) hold prominence in the firm's chief characteristics. CSR can be explained as a notion that a firm's existence is not mere profit-seeking, it also implies the responsibility beyond the firm shareholders, that are other groups in the society and environment. It does not have to be necessarily enforced by the law, in fact, more cognitive (Jones 1980). It rather emerges when a firm aims consciously consider the wellbeing of those who are affected by its economic operations. While economic activities are considered themselves to uplift the

society by job creation and wealth generation, social harms are also accompanying them, meaning thereby workplace mistreatment and employee abuse, ecological concerns, consumer abuses, and so on. Five paramount phases of CSR are termed as Corporate Social Trusteeship (CST), Corporate Social Responsiveness (CSR), Corporate-Business Ethics (CBE), and Corporate Global Citizenship CGC (Weber and Wasieleski 2018).

The induction of cross-culture attitudes in CSR activities is significant. Companies may have their operations spread in different geographies and the culturally distinct location where one approach for all may not deem fit. Understanding the concept, cross-culture means the concept that people from different geographies and nations possess different backgrounds, ethics, and ethnicities which society usually shapes. With the advent of globalization, businesses have asserted high importance to cross-cultural integrations and address them. It extends from differences doing business operations to meticulous personal details like body language and expressions (Kopp 2019).

It poses a challenge for a company to cater the CSR operations in line with the cross-cultural different attitude and their respective requirements, and expectations, which should reflect inside and outside the firm and match the societal threshold.

Introduction

Industrialization and globalization have increased at an exponential pace since 1989. The emergence of the disintegration of the Soviet bloc, the European Union formation, the creation of the World Trade Organization (WTO), and the North American Free Trade Agreement (NAFTA) has changed the overall global economic and business outlook concepts. The inclusion of China in WTO and the US economic recovery from the rescission emergence of various giant multinational corporations have created a tendency to seek new raw material sources, the discovery of new markets, and especially, more cost-effective locations.

Some businesses gain success while others deem to fail as their capability to adapt to the cultural challenges, different international business demands they face are limited (Doremus et al. 1998; Ricks 1999; Apud et al. 2003; Tung 1982).

This leads to the expansion of the company's operations in a different country or location, initiating huge Foreign Direct Investment (FDI), but it also brings the question of the local community and environment compensation sufficiently. They are prone to the harmful impacts of the company's operations, meaning thereby, the production processes and use of natural resources for running a company's operations. Firms nowadays do imply critical emphasis to the CSR activities to address those segments, but the CSR activities should have a trickle-down beneficial effect on the society, on people, catering environment and in line with the culture of the particular society it functions in. CSR activities can create a win-win situation for the company and the environment. But merely implementing a global CSR program is not facile, it is vulnerable to challenges and cultural differentiations, as the global corporations are spread in continents. The companies' marketers and policymakers are obliged to be aware of these multiverse societal demands in the geographies they operate to contrive CSR policies accordingly (Tai and Chuang 2014).

The importance of addressing the cross-cultural issues and incorporating them into a company's CSR strategies is critical for a firm's survival and as well as goodwill. The significance of the subject can be observed in various studies. Around an estimated 50 to 45 percent of managers who are sent from the USA to other company locations overseas tend to fail aimed the unawareness of cross-cultural scenarios, costing approximately \$one million (Hill 2001). Moreover, above these costs are the intangible costs, that is, loss of opportunities, damage a firm's name and reputation, losing local goodwill and relationship with partners that hamper the firm even more (Storti 2001). Therefore, a firm's will to its CSR policies may be in good intent but the lack of awareness of cross-cultural integrations can lead to serious consequences.

Important Aspects

These challenges arising to the CSR strategies of the companies globally ask for a holistic approach. Termed as cultural competence, C.C, is an aspect that can succor firms deal with cross-cultural attitudes, which they come across internationally, which firms must consider while initiating CSR activities accordingly. C.C is drawn skills set for the firms, comprising of knowledge, training, and competence to cater successfully the cross-cultural attitudes, and behaviors towards their CSR strategies, particularly abroad. The eminent work of Black and Mendenhall (1990), highlighting prior literature, conjugates the cross-cultural training and abilities of the firms to incorporate the cross-cultural attitudes. These cross-cultural training and abilities are personal ones: the maintenance of self (mental health, psychological well-being, stress reduction, feelings of self-confidence), skills related to the fostering of relationships with host nationals, and cognitive skills that promote a correct perception of the host environment and its social systems. They mention the social learning theory, SLT, and a present model depicting the integration of elements of cross-cultural training and SLT, and how they interact in affecting cross-cultural skill development, adjustment, and performance. The social learning theory crowned by Bandura states that individuals learn from their experience and has four central elements: attention, retention, reproduction, and incentives.

Mentioned below the presented model, it is argued that individual differences have a cohesive impact on the training of key firms' personnel and the policies. Locus of control is an important factor in this vein, meaning thereby, it is a belief in individuals that events occur as per their actions and their abilities so higher efficiency and effectiveness will be ensured, corresponding to higher expectations as well. This transcends to more motivation eventually. These motivations will impact the cross-cultural training, will include more rigorous models for training, impact the attentions for learning about

Cross-Cultural Attitudes to CSR, Fig. 1 Model of cross-cultural training and training (Black and Mendenhall 1990)

cross-cultural behaviors, retention of the learned skills and imply them, reproduce the learned skills into meaningful interactions, help to develop the skills, adjusting to the cross-cultural attitudes, impacting performance eventually. Incentives also have a major role in retention, reproduction, and attention. Incentives can both be in the shape of external and internal. They are paramount as they influence the degree to which individuals follow the desired behavior that helps to manage the CSR activities in line with cross-cultural behaviors (Fig. 1).

The CSR strategies of the firm cannot ignore the fact that some delicate strategies for social benefits and compensation perspective tailored for a region might be completely stalemated and opposed in others. A detailed perspective to riposte is to first recognize the differences, then devise the CSR actions.

Recognition is the first step, and the recognition of culture is the premise of the firm's CSR. Awareness of the culture can be individualistic

or collectivistic, which is key to regale that particular society and understand which aspect is most important to give voice to in CSR activities, followed by respect for the traditions and customs adopted over time in the target society. Any CSR activity that contradicts the cultural values could end in a hoax for a company. Finally, to reconcile, that is, to map knowledge and cultural empathy to reach joint goals for social responsibility for the society and the company.

Summary

Companies are considering corporate social responsibility as a key element in their profile and delicate tremendous focus and resources to it. Societal pressure, regulations, the nature of the company, or competitive advantage are the prime causes of a company adopting CSR activities. Due to massive globalization, companies have

expanded internationally at a rapid pace. That brings challenges especially to address the cross-cultural attitudes and the same size fits all approach for CSR strategies is impractical. The provision asks for developing a special skill set, training, and awareness to the challenge and creates such harmony in the execution of CSR activities that they are serving the purpose of social and environmental benefits.

Description

Culture is something socially constructed and historically infused in people's beliefs, perceptions, and behavior. It has been defined as "the collective programming of the mind which distinguishes the members of one category of people from another" (Hofstede 1980). Since business is made by people, all organizational activities, from leadership to decision-making, are somehow impacted by culture. Cross-cultural management is the group of strategies and policies, usually adopted by international or multinational firms, aiming to improve the coordination and cooperation among employees and between staff and external business actors that embody different behavioral norms and interpersonal expectations due to their respective national cultures. The basic assumption of cross-cultural management is that there is the potential of misunderstandings in the context of relationships between individuals and organizations from differing cultural backgrounds. From the 1970s to the 1990s, culture was described as a barrier to interaction and source of frictions. Yet, recently, the idea of culture as a resource of organizational learning and competitive advantage also emerged. Companies that leverage from their multicultural workforce can better satisfy different clients and speed up knowledge transfers. Therefore, the goal of cross-cultural management studies is to help identify the characteristics of particular cultures, make comparisons, and provide insights on how to conduct the cross-cultural

interactions to both avoid conflicts and get benefits from the correct handling of cultural differences.

Introduction: International Business and the Encounter of Different National Cultures

Information technology, globalization, and fast transportation systems have made physical borders meaningless, but they have not really changed local beliefs, mindsets, and common practices that are rooted in national cultures. Globalization has made the world smaller but we do not have one borderless society. Divergent customs, conventions, and business practices still exist. The impact of national culture difference is relevant to all areas of business; therefore, managers need to know what to do and what not to do in certain countries or when working with partners and employees from other nations.

This means that managers working with foreign subsidiaries, suppliers, or customers located around the world need to develop adequate management skills: understand the behavior of people located around the world and manage different people to make them work in organizations where it is necessary to interact with subjects with several cultures. Studies of cross-cultural management, originated in the field of international business, actually aim to understand how managers and organizations shall deal with “international and multicultural spheres” (Adler 1983a, 1991). They focus on the international differences among managerial systems and organizational structures of firms located in different countries and link such differences to the domestic culture. While traditional international studies started in the 1950s ascribed country differences in managerial models to tangible and measurable aspects of the local context, such as its economic development, technological advance, or type of political and legal system (contingency approach), cross-cultural management research believes that local culture has a great impact on people and organizations’ behavior (cultural approach). Culture is more than a moderating variable; it is

conceived as the determinant of many managerial outcomes. Therefore, cross-cultural management studies seek to unveil how culture informs managerial systems, how tools and systems can be transferred from one country to another effectively, and how it is possible to improve the interaction of co-workers with different background cultures, and company’s interaction with foreign suppliers, customers, and alliance partners.

Researchers of cross-cultural management assume that globalization does not cause cultural convergence (i.e., more similar behaviors). Actually, globalization may reinforce unique beliefs and value systems (consider Muslim countries that hinder Western role models). The reality is that both convergence and divergence occur and managers need to understand and anticipate both patterns. Consequently, the old-fashioned thesis of Hickson et al. (1974) that sustains a culture-free approach to international business cannot be maintained. Moreover, if we adopt a culture-bound approach, it means that there is no unique best organizational model that may fit all firms around the world. If no universal model of organization structure exists, caution has to be used when trying to transfer managerial systems, tools, practices, or procedures from one organization (i.e., the holding company) to its international subsidiaries or, in case of a merger or an acquisition, from the acquirer company to the target organization.

Origin and Content of Cross-Cultural Management

Cross-cultural management is defined as “the study of management in a cross-cultural context. It includes the study of the influence of societal culture on managers and management practice as well as the study of the cultural orientations of individuals and organization members” (Thomas 2016). As originally stated by Adler (1983b), “the focus of cross-cultural management studies is the behavior of people from different cultures” working together within the same organization or in different organizations located in two or more cultures. Thus, it concentrates on the micro

level – the study of people – rather than on the macro level – the study of the organizations.

The development of cross-cultural management studies can be tracked back to the work of three key authors. In 1980, Hofstede classified the cultural orientation of more than 88,000 employees from 40 countries according to four dimensions (individualism/collectivism, power distance, uncertainty avoidance, and masculinity/femininity), then Adler (1991) examined the impact of culture on different organizational functions and departments. Few years later, Fons Trompenaars (1993) administered a questionnaire to over 15,000 managers from 28 countries to classify national cultures according to five dimensions, which are partially similar to Hofstede's dimensions.

All of these authors rely on the classic concept of culture developed by Western anthropologists in the 1950s (in particular relying on interpretative anthropology), which is conceived as a stable system of values, norms, and assumptions transmitted through socialization. All of them rely on sociological theories of social functions and structures, which provide taxonomies for analyzing cultures (Peterson and Soendergaard 2008) and focus on national culture, assuming that social behavior of individuals is deeply connected to national values and beliefs. Although they recognize the existence of difference layers of cultures (national, professional, industry, and corporate culture), national culture is the most important because it is rooted in the basic assumptions that “program the mind of people.” This is the first layer of culture that is the most difficult to change and depends on where we grew up. On the contrary, the corporate, industry and professional cultures are learned in the course of education, through training and in organizational life, related to practices and conventions, and therefore are subject to change.

Hofstede is undoubtedly the most cited author: Trompenaars (1993) credits Hofstede “for opening management's eyes to the importance of the [cross-cultural management] subject.” However, its work has been also criticized (Søderberg and Holden 2002), especially because he equates culture with national boundaries, while the today's

global and interconnected societies indicate that there are many multicultural realities within one single country. In other terms, boundaries within cultural communities are fluid and cultures are more subject to change.

Research on cross-cultural management assumes that cultural diversity may generate costly misunderstandings and business failure if not properly addressed. Ignoring or mishandling national differences can imply:

- Misreading the potential of cross-border acquisitions, mergers, or alliances
- Inability to conduct post-merger integration
- Inability to retain and motivate employees of different countries
- Inability to transfer practices and generate synergies from cross-fertilization
- Problems in managing expatriates located in foreign subsidiaries
- Marketing and advertising blunders

All these issues arise when a company goes abroad. Therefore, cross-cultural management is strictly related to international strategy (Bartlett and Ghoshal 1989). Until recently, the topic was often subsumed in texts on international management and there were very few texts devoted solely to cross-cultural management (see, for example, the book of Thomas and Peterson 2014), while today's cross-cultural research also embraces the study of similar issues due to different regional, professional, and organizational cultures.

Each issue represents a stream of research. So, there were studies focusing on international negotiation (Brett and Okumura 1998) as well as studies specialized in the management of global teams and expatriates (Steers et al. 2010). In addition, there are studies focusing on how companies (their top management) conceive cultural differences and consequently decide which international patterns to adopt (i.e., which type of structures and coordination mechanisms). These studies identify: (i) *international companies* that consider cultural diversity as a source of conflict and therefore try to impose the head quarter's culture universally, (ii) *multinational firms* that are aware of both problems and benefits related to

cultural differences and therefore favor the coexistence of differences, and (iii) *transnational corporations* where heterogeneity is considered essential and cultural interactions are welcomed. In this last situation, cultural differences are not an obstacle but represent a source of competitive advantage.

Another important field of analysis is the managerial mind and how managers shall develop global management skills to avoid cited negative issues. In this case, a manager can follow two main approaches: he/she can try to adapt to another culture (this is what expatriate do, when they have to work in a different country for several years, so they learn the language, the habits, etc.) or he/she can develop a multicultural mindset (this is necessary when the manager deals with several different countries and cultures) that can help understand why others behave as they do. In the first case, after a cultural shock, the manager thinks and behaves like a local. In the second case, it would be impossible for a manager to adapt to several different international encounters, therefore he/she learn (usually through specialized training) how to identify his or her cultural values and biases, and then develop a set of culturally appropriate interpersonal skills. Some authors refer to this ability to live and work in and across cultures, and to negotiate cross-cultural differences as the ability to develop a global mindset (Gupta and Govindarajan 2002; Levy et al. 2007). “An individual with a global mindset has an understanding and appreciation of local cross-cultural differences while maintaining the identity of their organization and a global view” (Groutsis et al. 2014).

Most recent cross-cultural management research concentrates on the examination of individual behaviors and the psychological perspectives of culture (i.e., it follows from psychological studies of individual attitudes, values, or personality dimensions) (Leung and Peterson 2010). So, we can find studies on the impact of culture on work-related attitudes, leadership, change management, decision-making, conflict management, motivation, entrepreneurial orientation, and reward allocation (Kirkman et al. 2006). These studies of individuals and teams frequently draw

from the work of Harry Triandis (1972) who is considered a pioneer of cross-cultural psychology. They are becoming extremely important because the acquisition of knowledge from employees and partners has become the key source of competitive advantage and consequently, it is fundamental to know how to retain the best subjects and facilitate effective knowledge sharing within a multicultural environment.

Diffusion of Cross-Cultural Management Studies across Fields of Research

Cross-cultural management benefits from several contributing disciplines including psychology, sociology, anthropology, and organizational behavior. Therefore, research on this topic can be found in academic journals of different fields or subject areas. To illustrate this point, a research query on the Scopus database containing academic articles including “cross-cultural management” in the title, abstract or the keywords has been run. Figure 1 indicates that business studies represent the majority but many articles published in the field of Social Sciences, Arts and Humanities, and Psychology are also listed.

The same query indicates that after 1996 cross-cultural management studies began to flourish, with a peak of 50 articles published only in 2010. Contributions are spread throughout different journals; most of them focusing on international business (like the “Journal of International Business Studies,” “Journal of International Management,” “Management International Review,” and “Thunderbird International Business Review”) and human resource management (see, for example, “Journal of Global Mobility,” “International Journal of Human Resource Management,” and “International Journal of Intercultural Relations”). In addition, two reviews were recently founded to offer researchers the possibility to publish original research in cross-cultural aspects of management, work and organization: the “International Journal of Cross Cultural Management” and “Cross Cultural and Strategic Management.” The first one was launched in 2001 by Sage publication and included a contribution of

Cross-Cultural Management, Fig. 1 Documents by subject area

Hofstede (titled “Culture’s Recent Consequences: Using Dimension Scores in Theory and Research”) and a contribution of Triandis (titled “The Study of Cross Cultural Management and Organization: The Future”). The second one is published by Emerald, since 2016, and was renamed from “Cross Cultural Management: An International Journal,” originally dating back to 1994.

Cross-Cultural Management Versus Intercultural Management Versus Diversity Management

Research on cross-cultural management is often associated to intercultural management. Yet, their object of study is different. Cross-cultural management research is devoted to the study of cultural differences within and outside the organizational context. Therefore, studies of cross-cultural management often include the mapping of national cultures or use these categorizations to make comparisons and help managers to effectively handle differences. Intercultural research, in contrast, is focused more on the process of interaction among cultures and the social impact of this intercultural interaction during communication (Barmeyer and Mayrhofer 2008). The research conducted in the field of

intercultural management is concerned with “critical incidents” produced in communicative and cooperative situations, which are due to cultural differences. A great emphasis is given to linguistic and ethno-cultural differences. Its aim is to improve the quality of intercultural communication, relations, collaboration, and knowledge sharing. Consequently, research of intercultural management mainly belongs to the area of communications and it is circulated through specialized journals like “International Journal of Intercultural Relations” and “Journal of Intercultural Communication Research.”

Research on cross-cultural management has also some intersections with diversity management (Lorbiecki and Gavin 2000). Both assume that a heterogeneous work force may either hinder or favor productivity and profit depending on how it is managed. Both focus on human resource management, i.e., how to maximize employee’s knowledge and expertise to better achieve organizational objectives. However, diversity management differs for its broader scope and its socio-political dimension. Diversity management is more than a multicultural issue as its scope refers to any kind of element that can make people feel different and behave differently from others. Diversity is linked to several factors such as culture, generation (old vs. young), gender (male or female), thinking, religion, level of ability or

disability, sexual orientation, or marital status. Therefore, diversity management can be applied even in domestic companies whenever there are individuals with different preferences and orientation. In addition, diversity management is often conceived as a socio-political strategy, which identifies the companies that most care about employees and consequently best attract talented people (Ng and Burke 2005). Since diversity management includes activities that disseminate acceptance of and respect for various racial, cultural, societal, geographic, economic, and political backgrounds, employees do not feel discriminated. Most diversity management efforts refer to the creation of an inclusive culture, a place that is “safe for differences,” where it is possible to maximize the full potential of every individual. Therefore, employees are less stressed, feel free to make innovative proposal and work better so that both the company and its people benefit from the inclusive context.

Summary

Cross-cultural management was born within international business studies driven by the necessity to understand the behavior of people in organizations around the world. Thus, its prime focus is on organizational behavior across different national cultures. The main goal of cross-cultural research is to advance the general guidelines that may anticipate and minimize the issues and problems related to multicultural encounters and thus promote effective managerial actions. In today's knowledge era, cross-cultural management is particularly helpful in leveraging innovations and learning at the global level, as it helps managers understand how to obtain and exploit the knowledge from worldwide sources.

Cross-Cultural Orientations and CSR

Katarzyna Klimkiewicz
Faculty of Management,
AGH University of Science and Technology,
Krakow, Poland

Synonyms

Cross-cultural approaches toward CSR; Cross-cultural orientations toward CSR; Cross-cultural perceptions of CSR; Cross-national differences in government involvement in CSR

Definition

Cross-cultural attitudes to CSR refer to the possible responses that different groups (e.g., organizations and stakeholders) may hold toward CSR, based upon shared norms, values, and beliefs. Understanding cross-cultural attitudes to CSR requires addressing the cultural context and the cognitive, affective, and behavioral dimensions of attitudinal responses (Fig. 1).

While the cognitive dimension addresses understanding CSR as a construct (e.g., instrumental, relational, or moral approach), the affective dimension refers to the degree of favorableness or unfavorableness of the response to CSR. For example, while some consumers prefer products labeled as responsibly manufactured, others may show distrust toward ethically labeled products and/or services. The behavioral dimension refers to actions taken as a response to the CSR signal. For example, customers may buy CSR-labeled products, and employees may be more willing to accept a job offer from an employer who stresses CSR values.

Introduction

Corporate social responsibility (CSR) is a socially constructed concept (Dahlsrud 2008) that reflects the social imperatives and social consequences of business success; therefore, the understanding of CSR may differ in different cultural and national settings (Matten and Moon 2008). CSR relates to the concept of the role of business in society, its obligations, and its impact on stakeholders. While culture may be considered to be the system of fundamental meanings and beliefs shared by a particular group of people or a society and which may evolve over time (Hofstede 2005), attitude represents a disposition to respond positively or adversely toward a given object. Attitudes are not universal and may differ across cultures and borders in terms of underlying meanings and issues; therefore, attitudes toward CSR may vary in terms of differences in understanding CSR concepts or country-specific issues with which business may struggle (e.g., communication transparency, corruption, an aging society, unemployment, lack of health and safety insurance). In response to external pressures, organizations can be guided by different motives. These drivers can be divided into three groups:

- Instrumental motives related to self-interest (gaining power, acquiring rare resources)

Cross-Cultural Orientations and CSR, Fig. 1 Framework for understanding cross-cultural attitudes to CSR

- Relational motives associated with fostering relationships with particular stakeholder groups
- Moral motives based on ethical principles and standards, such as shared responsibility, sustainable development, and concern for future generations (Aguilera et al. 2007).

Under pressure, organizations formulate policies; implement standards, regulations, and certifications; and report on social issues (e.g., diversity, fair wages, social and environmental policies). Actions taken by organizations are aimed primarily at building credibility and creating a reputation that allows them to gain acceptance for their activities. This impacts organizational practices, the corporate culture, and specific guidelines for codes of conduct designed according to socially accepted norms and rules (Aguilera et al. 2007).

Following a proposed framework for understanding cross-cultural attitudes to CSR requires addressing the implications of the cultural context for (1) the development of CSR within a broader national framework both in developed and in developing countries; (2) exploring the organization's responses to CSR across different cultural settings; and (3) understanding individual perceptions of CSR and the significance of individual attitudes toward CSR, e.g., for customer choice or job offer acceptance.

The Development of CSR Within a Broader National Framework

The roots of our understanding of CSR are examined in the work of American researchers (Carroll 1999). Matten and Moon (2008) propose that long-standing, historically entrenched institutions create differences in CSR among various countries. The authors point at four key historical features of national institutional frameworks: the political system, the financial system, the education and labor system, and the cultural system – all of which influence the national business system.

In the USA, enterprises are perceived as social actors who play the role of citizens (Habisch 2003). A good citizen is characterized above all by the attitude of a “philanthropist” who actively supports society, including private individuals and entire enterprises. Therefore, CSR in this country has been mainly understood in terms of philanthropic issues (Porter and Kramer 2006), which may also become strategic for business development.

In Europe, social responsibility resulted from the role attributed to entrepreneurs as part of the socioeconomic system. It was perceived as a fundamental value embedded in the system, not subject to any discussion. Therefore, there was no need to communicate separately on the organization's strategies and practices or on the

social responsibilities of the firm. *Matten and Moon (2008)* note that the concept of CSR in Europe is not new but it is new to treat it as an element of corporate policy in relation to the social environment.

Jurgens et al. (2010) explain the difference between these two regions, acknowledging differences in the way they look at stakeholders and how relations with each group are managed. In North America, open debate on the role of entrepreneurs in society has influenced current legislation. While the European stakeholder model includes important stakeholder groups in the process of policy and decision-making, US firms reserve board representation for institutional investors or major shareholders (*Jurgens et al. 2010*). Also, *Matten and Moon (2008)* describe the institutional context of CSR, stressing the differences in the European and Anglo-American approach. The authors argue that, in Europe, CSR is implicitly embedded in corporate structures and culture but, in more individualistic cultures, as, e.g., the USA or the UK, CSR has evolved as separate practices and strategies built on the regular business model. The difference in the perception of corporate social responsibility in both cultural settings becomes visible primarily in the fact that many of its aspects, widely discussed in the USA, are considered in Europe to be an element of the socioeconomic order (*Habisch 2003*). First, development of common socioeconomic systems in European countries has encouraged open discussion on the role and responsibility of enterprise in society. As a result, the explicit idea of CSR, treated as an enterprise policy, has strongly influenced the contemporary concept of CSR in Europe.

The approach to a comparative understanding of CSR requires basic prerequisites, such as a functioning market and governmental and legal institutions that guarantee that business acts in line with societal interests. The existing civil society is responsible for articulating social values and preferences by which business is obliged to perform (*Matten and Moon 2008*). The impact of cultural settings in developing countries requires, therefore, a distinct perspective.

CSR in developing countries is oriented toward socioeconomic priorities necessitated by

underdeveloped infrastructures, such as poverty alleviation, supporting and increasing awareness of healthcare and environmental issues, and providing education and empowerment to marginalized groups. It might be defined as representing “the formal and informal ways in which business makes a contribution to improve the governance, social, ethical, labor and environmental conditions of the developing countries in which they operate, while remaining sensitive to prevailing religious, historical and cultural context” (*Visser 2009*, p. 131).

The role of CSR in developing countries is twofold:

1. Supporting: CSR must support political reforms in order to cover governance gaps that occur due to corruption or lack of resources in order to provide efficient social services (*Idowu et al. 2015; Visser 2009*), provide access to basic goods and services (*Prahalad and Hart 2002*), and respond to economic or social crises and catastrophes that cannot be managed by local services.
2. Controlling and monitoring: In developing countries, the role of CSR is to monitor and control investment initiatives in order to insure their economic, social, and environmental value and assess company activities according to their compatibility with international standards. Here, one of the most compelling topics is sustainability in the global supply chain, where, in addition to economic criteria, social and environmental criteria must also be considered. These strongly impact local economies and existing labor standards.

The main focus of CSR in developing countries may also differ. After providing a systematic review of CSR research in developing countries, *Visser (2009)* shows that, in Africa, the main focus is on the ethical dimension (e.g., ethics of colonialism and apartheid, prevalence of corruption and fraud, ethical investment, and individual ethics of South African managers). The author expects, however, that in the coming years, topics such as stakeholder engagement, social responsibility, and health issues (including HIV/AIDS) will move up on the agenda. In turn,

CSR in Latin America is strongly influenced by socioeconomic and political conditions, such as deforestation, unemployment, inequality, and crime (Visser 2009).

Organizational Responses to CSR Across Different Cultural Settings

This stream of research explores the importance of the cultural dimension as a predictor of CSR or corporate social performance (CSP). The most frequently used concepts refer to Hofstede's six cultural dimensions (Hofstede 2005). Findings, however, are mixed. According to Waldman et al. (2006), the individualism-collectivism dimension is one of the most important predictors of CSR. While it is argued that a collectivistic culture is more supportive toward the adoption of CSR (Waldman et al. 2006), cultures with high levels of power distance and pragmatism won't support this approach to any extent (Dawkins et al. 2016). In their study, Ringov and Zollo (2007) show that power distance and masculinity have a negative effect on CSR and environmental performance. Thus, they find no significant differences with respect to individualism and uncertainty avoidance (Ringov and Zollo 2007).

Ho et al. (2012) examined the impact of national culture and geographic environment on firms' CSP. Based on a global CSP database of companies from 49 countries, they determined that Hofstede's cultural dimensions are significantly associated with CSP. According to their study, higher CSP is significantly associated with cultures that are characterized by higher power distance, are more collectivist and more masculine, and exhibit more uncertainty avoidance (Ho et al. 2012). Halkos and Skouloudis (2016) argue that long-term versus short-term orientation and indulgence versus restraint positively affect CSR, while uncertainty avoidance has a negative effect. They find no significant effect for individualism, power distance, and masculinity (Halkos and Skouloudis 2016). Gallén and Peraíta's recent study (2018) examined CSR disclosure in

countries with higher and lower per capita GDP. The authors conclude that, "in countries with higher GDPPC, CSR disclosure is negatively related to individualism and masculinity and positively related to uncertainty avoidance and indulgence. When focusing on countries with a lower GDPPC, the results suggest that CSR disclosure is negatively related to power distance and positively related to uncertainty avoidance. Moreover, five of Hofstede's six cultural dimensions negatively affect sustainability disclosure in countries with middle GDPPC" (Gallén and Peraíta 2018, p. 2967).

The Significance of Individual Attitudes Toward CSR in Cross-Cultural Research

Referring to the second question – how cultural settings influence stakeholder responses toward CSR – researchers concentrate on the differences in individual sensitivity toward the specific issues identified in the CSR concept definition. The differences in individual attitudes toward CSR across borders help in understanding how CSR "works" in different contexts, both institutional and cultural. Here, individual reaction to the CSR message by different groups of stakeholders, such as customers, employees, job applicants, and managers, is investigated. A range of comparative studies shows that differences in manager attitudes toward CSR are influenced by values embedded in the national and organizational culture and their profession (Williams and Aguilera 2009) that may impact CSR outcomes at their firms (Aguilera et al. 2007; Hemingway and MacLagan 2004). In turn, as the degree of interest in CSR shown by consumers impacts company perceptions, cross-cultural analysis of customer attitudes toward CSR concentrates on its significance on the decision-making process. For example, Maignan (2001) found that customers in Europe (French and German) were more actively willing to support socially responsible organizations than were US consumers. Research shows that incorporating the CSR message into marketing campaigns in cross-cultural settings is more

influential in developed than in emerging economies (Auger et al. 2010).

CSR researched as one of the features of global brands generally evokes a positive company image (Becker-Olsen et al. 2011); however, companies shouldn't overlook the specific local circumstances which may impact customer behavior, such as attachment to local products; different levels of sensitivity toward ethical, social, or ecological issues; or awareness of ethical consumption and a sustainable chain of supply (Karaosman et al. 2015; Singh et al. 2008).

A separate field of research on cross-cultural attitudes toward CSR refers to the employee-employer relationship. While researching the impact of CSR on job attitudes, Dawkins et al. (2016) found that respondents from three different countries were willing to work for socially responsible firms to a similar extent; however, they came to their decisions in different ways. The dimensions of individualism-collectivism and power distance (according to the work of Hofstede 2005) seem to have a moderating effect on expectations toward CSR and job choice (Dawkins et al. 2016).

Final Comments

Research on cross-cultural attitudes to CSR is a broadly investigated field that holds the interest of researchers from all over the globe. While, in most cases, qualitative approaches use descriptive case studies and provide comparison of practices in different countries, the quantitative approach focuses on exploring the importance of the cultural setting for CSR disclosure, impact on CSP, and stakeholder sensitivity toward various aspects of CSR. The current state of knowledge provides substantive support for acknowledging culture and values as core determinants of varying approaches to CSR attitudes, both organizational and individual. The mixed and often contradicting findings, however, suggest that this field requires a more systemic approach and rethinking of methodological tools. Standardized questionnaires developed for some

cultural settings may work differently in diverse cultural settings. The socially constructed nature of CSR also encourages acceptance of the diversity of definitions and perspectives in cross-cultural research. However, this presents a great challenge for researchers to develop a systematic approach at all levels – micro, mezzo, and macro.

Summary

CSR may be differently perceived and adopted by different stakeholder groups, such as customers, employees, or investors. Specifying the subject means, therefore, addressing a distinct person or group of people who express their attitudes toward CSR. Thus, the cultural context not only determines individual responses and expectations toward organizations but also shapes the governance framework that impacts employees and other stakeholders within organizations. In this case, the task is to identify the attitude of an organization. This attitude may be reflected in approaches adopted by the organization toward CSR. For example, the cognitive dimension of CSR may be strategically or altruistically driven. It may be expressed as diverse policies and practices linked to philanthropy, public relations, risk and/or stakeholder management, and innovative business models or through incorporation of normative values into the corporate culture. Also, national governments may put more or less emphasis on CSR, and this may be reflected in national regulations and guidelines. This, in turn, will impact the organization's attitudes to CSR and may accordingly promote certain aspects of CSR (e.g., pro-environmental or anti-discriminatory practices).

Description

Over the last six decades, corporate social responsibility has evolved significantly from simple philanthropy and ad hoc programs toward broader, integrated strategies and innovative business models. One influential model has been developed by Wayne Visser. Visser (2012a) presented corporate social responsibility development in five overlapping ages with the first four comprising CSR 1.0 and the fifth, being CSR 2.0. The five ages are (1) age of greed with defensive CSR; (2) age of philanthropy with charitable CSR; (3) age of marketing with promotional CSR; (4) age of management and strategic CSR; (5) age of responsibility and systemic CSR. In the age of responsibility and systemic CSR, CSR shifts from classic corporate social responsibility (CSR 1.0) toward an interactive, stakeholder-driven, and systemic approach of corporate sustainability and responsibility (CSR 2.0). The new CSR 2.0 model constitutes a reorientation of the purpose of business, shifting from serving shareholders toward serving society through the provision of products and services that enhance social welfare (Visser 2010). As such, it embraces **responsible capitalism**'s principles: productive investment (in opposition to financial speculation); long termism; transparency; full-cost accounting (internalization of externalities); inclusion (shared value creation and business at bottom of the pyramid – see ► [“Base of the Pyramid”](#)). Subsequent models have classified CSR's ages as CSR 1.0, CSR 2.0, and CSR 3.0.

CSR 1.0

The classic notion of corporate social responsibility, Visser argued, developed throughout four ages. First, the age of greed was characterized by its absolute dedication to the primacy of shareholder interest and trust in the “invisible hand” of the market. In this age, **CSR** is best described as **defensive or coerced** (Visser 2012b). Social and environmental initiatives are aimed purely at keeping civil pressure down and are undertaken only if and when it can be shown that shareholder value will be protected or promoted as a result

(Fleming and Jones 2013). Social and environmental programs are also harnessed in order to reduce political costs, avoid taxes and fees, and help a company to obtain certain benefits from the government and justify profits (Frias-Aceituno et al. 2014). The first age's ad hoc interventions are seen as a method to fend off regulation (Mullerat 2010, pp. 448–449) or avoid costly repercussion such as fines, lawsuits, consumer boycotts, and related decreases in sales (Husted and Salazar 2006).

In the second age, the age of philanthropy, there is a social expectation that business should give back to society and that rich should help poor (Visser 2012b). In other words, there was presupposition that wealth generation is inherently related with negative impacts on society and so should be recompensed. Thus, socially responsible activities need not be related to the core business strategy – they could focus on “altruistic” giving back to the society or compensating for negative impacts. In this age, there was no focus on attempts to minimize those impacts or change the very nature of business. This **charitable CSR**, of the philanthropy age, was limited to support of various social and environmental causes through donations and sponsorships. CSR was understood as a way in which the company redistributes value, rather than generates it, and was perceived as a cost or “as an ‘add-on’ luxury that can be only afforded by the most successful businesses” (Freeman and McVea 2001).

Third, in the age of marketing, CSR used to put a strong emphasis on the reputation and brand building. CSR is viewed as a PR tool (Visser 2012b). Such **promotional CSR** is rarely related to the core business strategy. Rather, the social initiatives are usually created by marketing or PR units and limited to cosmetic actions and glossy CSR reports (Porter and Kramer 2006). The basic and main objective of the business, as Professor Yunus (2007:16) argues, is to generate as much profit as possible regardless of the impact it might have on society and the environment. If the impact on society and the environment turns out to be sufficiently negative to attract undue attention, then management might decide to donate some portion of the profits for social

causes, making sure that their generosity attracts appropriate media attention. CSR has simply become a marketing and branding tool (Fleming and Jones 2013), often as greenwash (see ► “Greenwashing”) (Faust 2006).

Finally, in the age of management, social and environmental activities are related to the company's core business through adherence to CSR codes and implementation of adequate CSR management systems with policy development, goal setting, implementation, auditing, and reporting (Visser 2012b). CSR of this age includes strategic CSR (see ► “Strategic Management and CSR”) referring to instrumental premises of stakeholder theory (see ► “Stakeholder Theory”) (Donaldson and Preston 1995), assuming that “to maximize shareholder value over an uncertain time frame, managers ought to pay attention to key stakeholder relationships” (Freeman 1999).

In the age of management, stakeholder management (see ► “Stakeholder Management”) and CSR are proposed as appropriate alternatives to shareholder primacy. They provide managers with a strategic approach to understand new opportunities, identify risks, and make strategic decisions to exploit the first and minimize the latter. This approach, contrary to the CSR of previous ages, goes beyond cost-perspective and profit redistribution toward building **business case for CSR** (Visser 2012b). Firm voluntarily invests in social and environmental initiatives, but designs them in a way that supports realization of the core business strategy (Husted and Salazar 2006; Lantos 2002). This approach is based on win-win assumptions about business–society relations, neglecting, however, potential conflict of interests. It focuses on incremental improvements related to social and environmental issues that are aligned with business strategy.

Visser's “Curses of CSR 1.0”

Limitations of CSR were identified by Visser as “curses” and assigned to his CSR 1.0. Like other critics of CSR (e.g., Faust 2006; Fleming and Jones 2013; Yunus 2007), Visser argued that although the concept of CSR had many positive

social and environmental impacts, it failed to identify and address the root causes of the world's most serious problems. Failure of CSR 1.0, therefore, was identified by Visser as related to three factors, his **Triple Curses of Modern CSR** (Visser 2010). A brief description of each follows.

The Curse of Incremental CSR

Management systems harnessed for CSR strategies are rooted in the total quality management concept basing on the idea of incremental continuous improvement. "The incremental approach to CSR, while replete with evidence of micro-scale, gradual improvements, has completely and utterly failed to make any impact on the massive sustainability crises that we face, many of which are getting worse at a pace that far outstrips any futile CSR-led attempts at amelioration" (Visser 2010, p. 2).

The Curse of Peripheral CSR

In this situation, Visser argues that CSR is largely limited to the biggest, highly visible companies in developed countries or their subsidiaries (Visser 2012b). What is more, in this context, CSR plays a peripheral role in those corporations (Visser 2010). In most cases, organizational structures like CSR manager and CSR departments are created to address social expectations but are decoupled from the actual business activity (Meyer and Rowan 1977). These structures are peripheral, and the business still remains focused on shareholder value maximization and short-term financial measures (Visser 2010). CSR practices are not embedded in the firm's DNA, but remain as an "add-on" to the **"business as usual."**

The Curse of Uneconomic CSR

Visser argued that empirical research provides mixed results concerning the relation between CSR and corporate performance (Margolis and Walsh 2003; Orlitzky et al. 2003), making the core, business case, argument for CSR 1.0 nonsense (Visser 2012b). Addressing sustainability challenges, he argued, requires strategic change and substantial long-term investment that may be "economically rational over a generation or two."

This rationality, however, is not rewarded by financial markets that remain focused on short-term gains (Visser 2010).

Accordingly, Visser believed he could discern a new, emerging type of CSR which was termed CSR 2.0.

CSR 2.0

CSR 2.0 or **Corporate Sustainability and Responsibility** model has emerged as an answer to the identified shortcomings of CSR 1.0. The final age of the CSR evolution, argued Visser, is the age of responsibility. This new age drives new, systemic approach to business social and environmental practices. CSR 2.0 "focuses on identifying and tackling the root causes of company's present unsustainability and irresponsibility, typically through innovating business models, revolutionizing their processes, products and services and lobbying for progressive national and international policies" (Visser 2012a, p. 19). Within this approach, business and social goals are tied up with each other, and CSR becomes a defining element for company's business model (Boons and Lüdeke-Freund 2013). Making a positive contribution to society becomes a new business philosophy (Visser 2010). Firm integrates its core business strategy and customer value proposition with social and environmental issues (Becker-Olsen 2014, p. 169).

The underlying concept of CSR 2.0 was based on the Web 2.0 revolution. It was a metaphor using the emergence of social media networks, user-generated content, and open source approaches for the web which Visser believed could be applied to CSR (Visser 2012b). With the advent of Web 2.0, stakeholders became more connected, informed, and engaged in collaborative projects. In the field of business endeavors, broad social collaboration led to the withdrawal of the social license to operate granted to CSR 1.0 companies, forcing them to shift toward more systematic solutions integrated into the business DNA.

CSR 2.0, argued Visser, can be defined by five principles: (1) Creativity (C), (2) Scalability (S),

(3) Responsiveness (R), (4) Glocality (2); (5) Circularity (0).

Principle of Creativity

CSR 2.0 is driven by creativity and innovation. The key to achieving the needed, strategic corporate sustainability that could address multifaceted global social and environmental problems is innovation, particularly social innovation (Osburg 2013). In order to identify and tackle the root causes of their present irresponsibility and meaningfully contribute to sustainable development, while achieving integration with economic goals, companies need to revolutionize their processes, products, and services (Visser and Kymal 2014), as well as radically innovate their business models (Boons and Lüdeke-Freund 2013; Schaltegger et al. 2012; Tukker et al. 2008; Yang et al. 2017).

Principle of Scalability

The scale and urgency of global problems require scalable solutions (Visser 2010) that could move sustainability beyond niche markets of premium-priced products to the mainstream. For instance, companies may harness choice editing, i.e., an active process of controlling or limiting the choices available to consumers, in order to promote sustainable consumption. Another scalable strategy is the Long Tail of CSR aimed at extending the reach of CSR and improving its ability to address specific problems. The Long Tail requires: (1) democratization of CSR production tools by moving CSR beyond single department to the whole organization and beyond big multinationals to national companies and SMEs; (2) democratization of CSR distribution through employee participation, crowdsourcing, support of social entrepreneurs, and bottom of the pyramid strategies (see ► “Base of the Pyramid”); (3) connecting CSR supply and demand through cross-sector partnerships and stakeholder involvement (Visser 2012b).

Principle of Responsiveness

“CSR 2.0 requires uncomfortable, transformative responsiveness, which questions whether the industry or the business model itself is part of the solution or part of the problem”

(Visser 2010, p. 4). Responsiveness 2.0 includes positive and constructive lobbying, engagement in social media, stakeholder participation, and cross-sector partnerships, as well as transparency based on knowledge sharing (Visser 2012b).

Principle of Glocality

In the age of responsibility, companies need to act according to the “think global, act local” idea. CSR initiatives need to recognize local contexts and offer tailored solutions without sacrificing universal principles (Visser 2010).

Principle of Circularity

Circularity of CSR 2.0 refers to the Cradle-to-Cradle (see ► “Cradle to Cradle”) design framework characterized by three principles derived from nature: (1) everything is a resource for something else; (2) use of clean and renewable energy; (3) celebration of diversity (Visser 2012b). The concept is not limited to the environment, but focuses also on business’s role in feeding and replenishing social and human capital. “CSR 2.0 raises the importance of meaning in work and life to equal status alongside ecological integrity and financial viability” (Visser 2010, p. 6).

CSR 3.0

Some authors (McElhaney 2011; Schneider 2012) propose three-stage model describing the evolution of CSR. CSR 1.0 notion describes philanthropic unstructured activities with limited social impact and no business benefits. This stage corresponds with the CSR modes typical for the first three ages described by Visser. CSR programs without connection to the core business are often driven by marketing/PR and aimed at legitimizing business activity. CSR 2.0 is based on a strategic business case approach. CSR is viewed as a strategic management concept generating value added for the company. Although it is related to the core business strategy, it creates merely incremental changes and improvements. Finally, CSR 3.0 illustrates pro-active approach based on systemic, organization-wide changes, dialogue, and cooperation with and between external

stakeholders. CSR is viewed as an innovative business strategy that aims at **shared value** creation (see ► “Porter and Kramer’s (2006) “Shared Value””).

Summary

CSR 1.0/2.0/3.0 describes the evolution of the CSR concept over the last six decades. CSR has evolved from defensive or philanthropic, ad hoc initiatives (CSR 1.0), through strategic business case-driven programs (CSR 2.0) to systemic innovation-driven solutions based on integrated approach to business and society relations (CSR 3.0).
